To improve learning in class

- Structure of my teaching

  one phenomena (one concept)

  how is this formed (process)? What's the mechanism?

  what's the function/derivatives?
- To remember concepts

  find the connection among different concepts

  read more about one concept (BMP)

Features of zebrafish and xenopus

- Common feature：

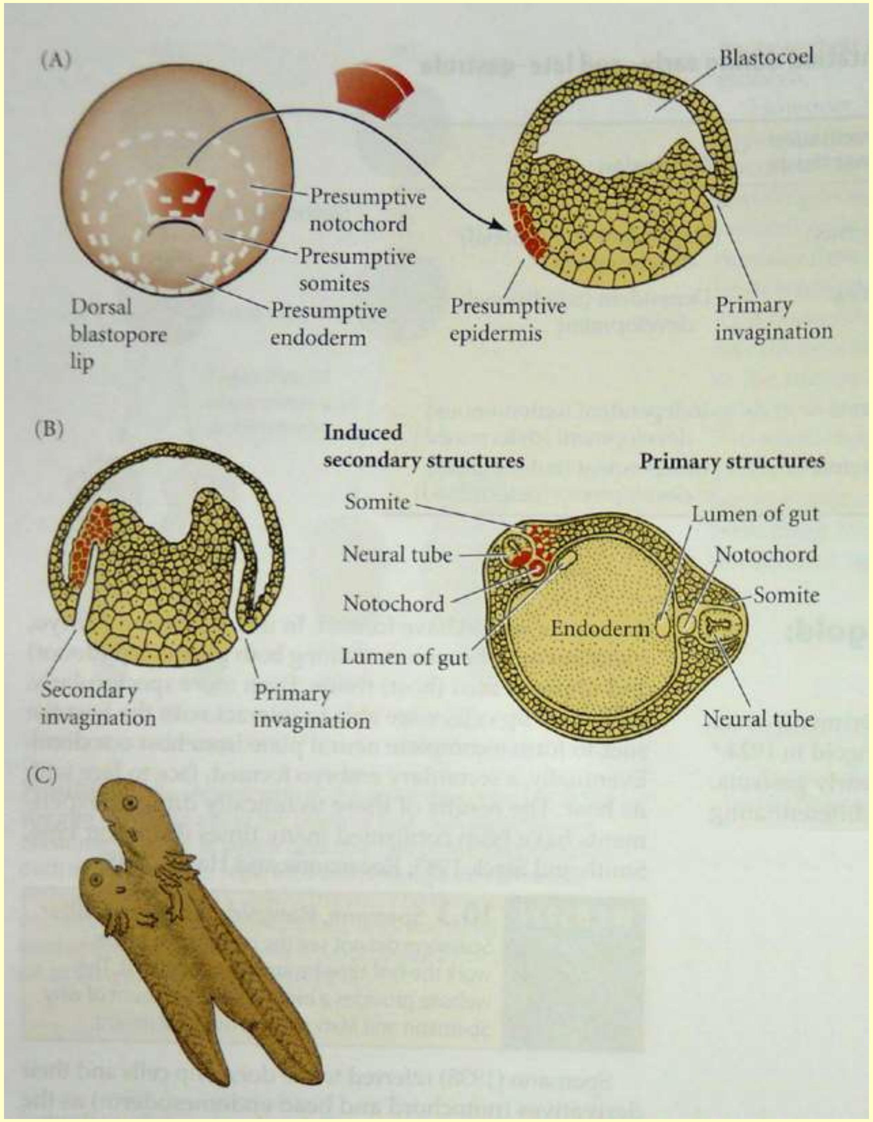
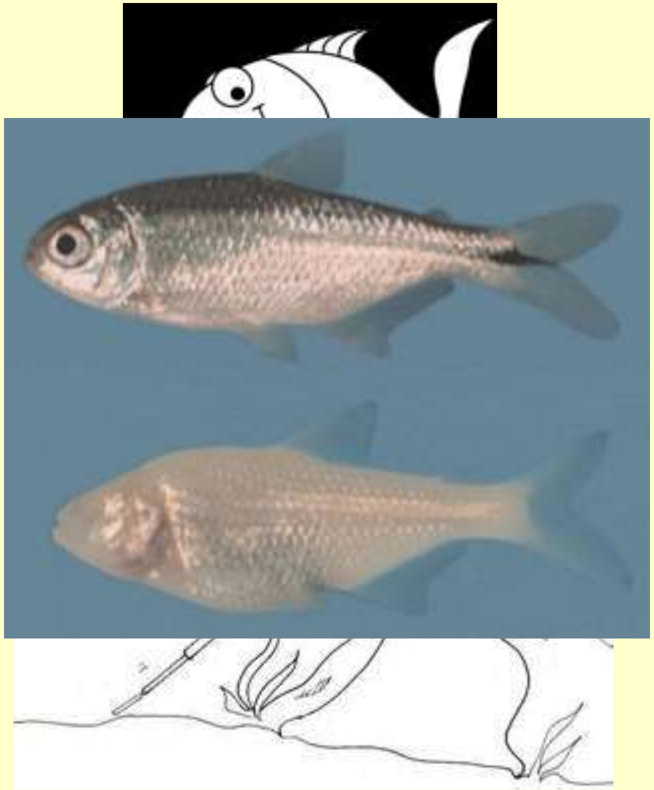
  large cells, develop *ex vivo,* develop very fast

- xenopus：transplantation
- zebrafish：mutant screen

Transplantation in xenopus



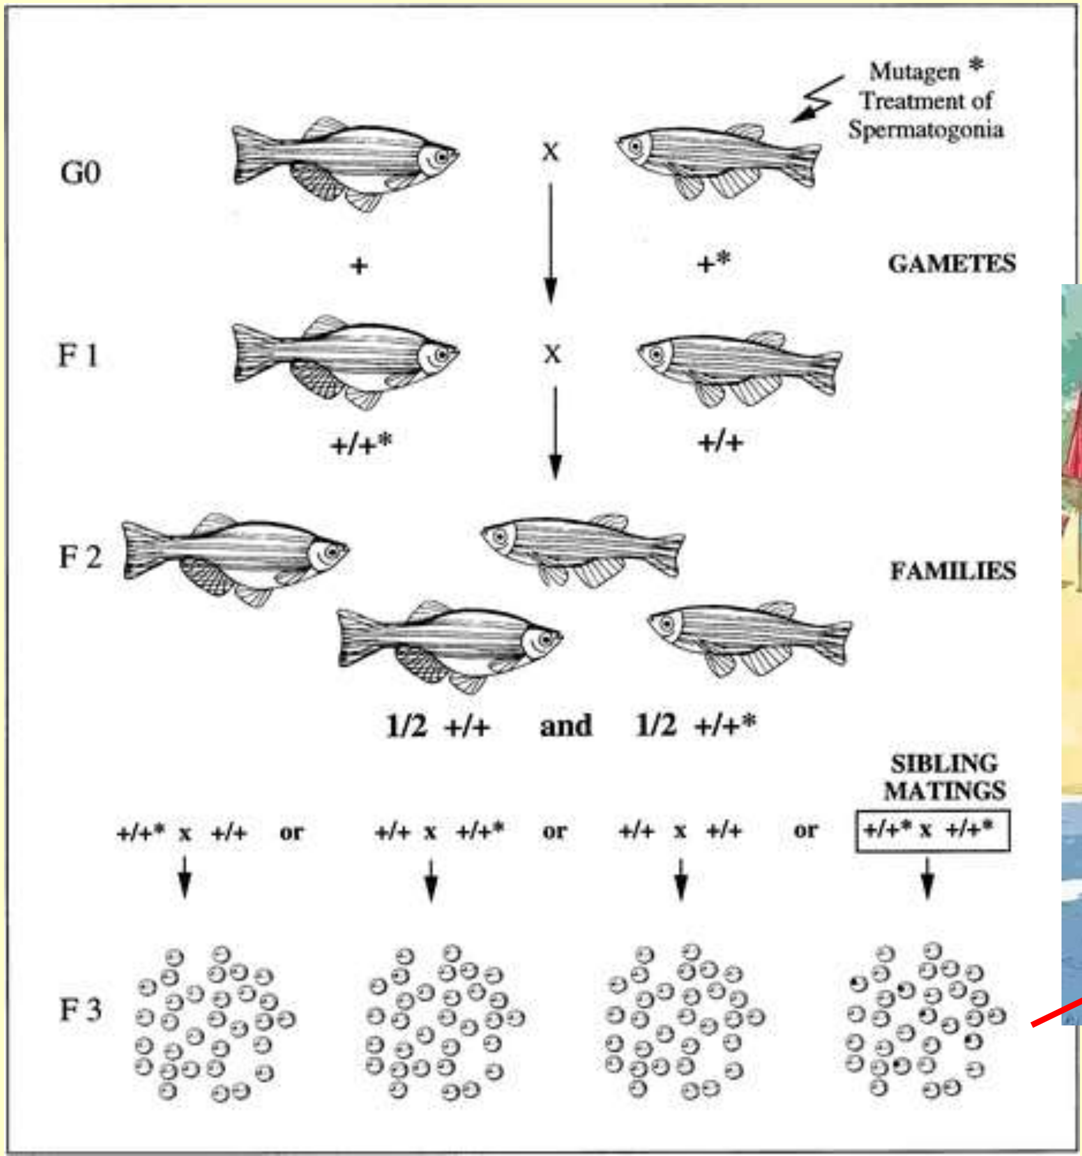
genetics

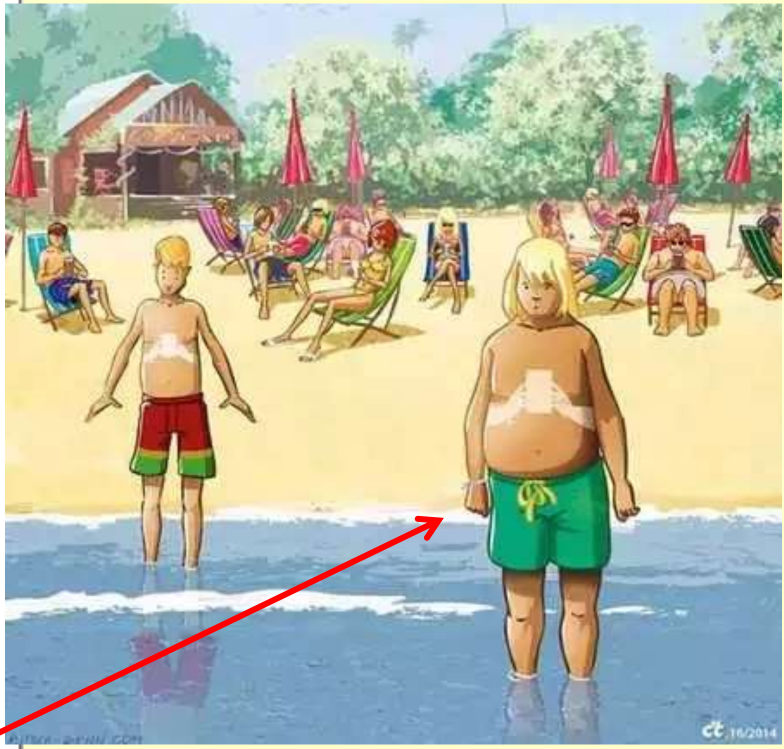


gene A is mutated in blind fish

gene A is required for
eye development

Forward genetics (phenotypes → genes): Genetic screen in zebrafish





Zebrafish development

outline

- Fertilization (受精)
- Cleavage and blastula stage (卵裂期和囊胚期)
- Gastrulation (原肠胚期)

1）Cell migrtion (细胞运动)

2）Mesoderm induction (中胚层诱导)

3）Specifying body axis(胚轴分化)

outline

- Fertilization (受精)
- Cleavage and blastula stage (卵裂期和囊胚期)
- Gastrulation (原肠胚期)

1）Cell migrtion (细胞运动)

2）Mesoderm induction (中胚层诱导)

3）Specifying body axis(胚轴分化)

Fertilization (受精)

NT: normalized time

Weaver, 2004

Similar process in zebrafish

Tran, *et. al*., 2012, Dev

outline

- Fertilization (受精)
- Cleavage and blastula stage (卵裂期和囊胚期)
- Gastrulation (原肠胚期)

1）Cell migrtion (细胞运动)

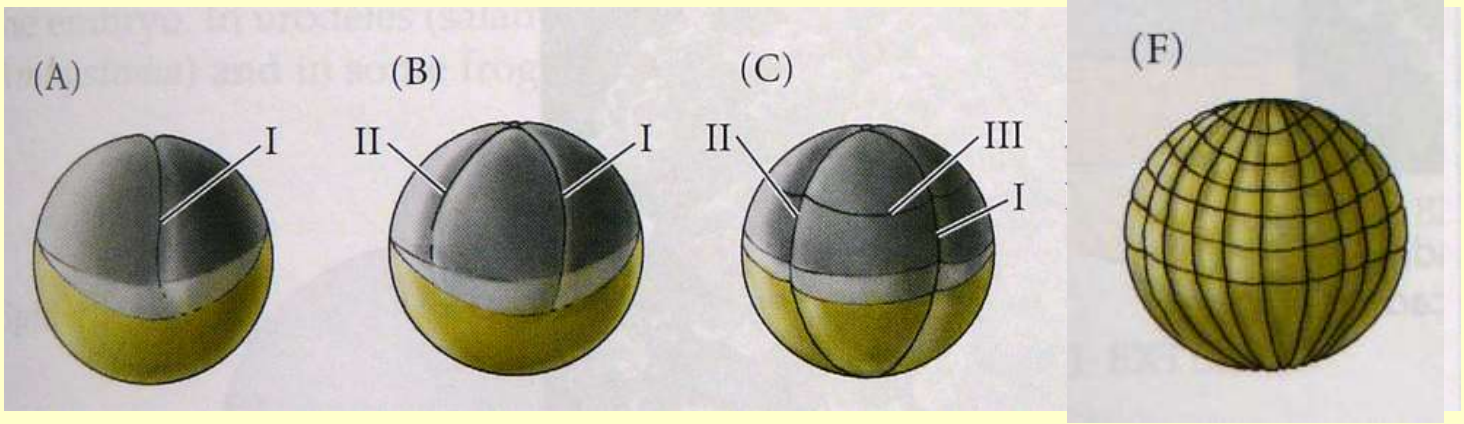
2）Mesoderm induction (中胚层诱导)

3）Specifying body axis(胚轴分化)

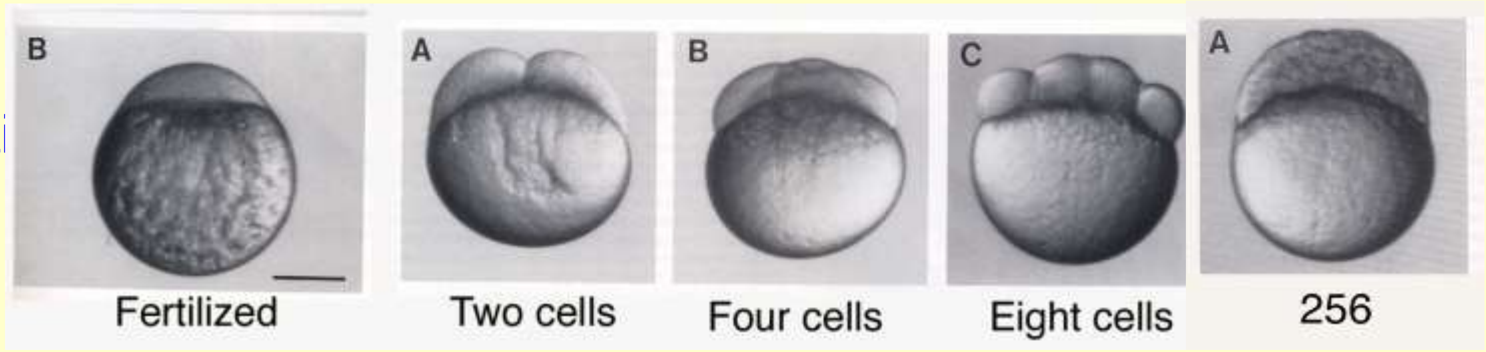
cleavage

- Different ways of cleavage：

Xenopus:
Holoblastic
Cleavage
(全裂)

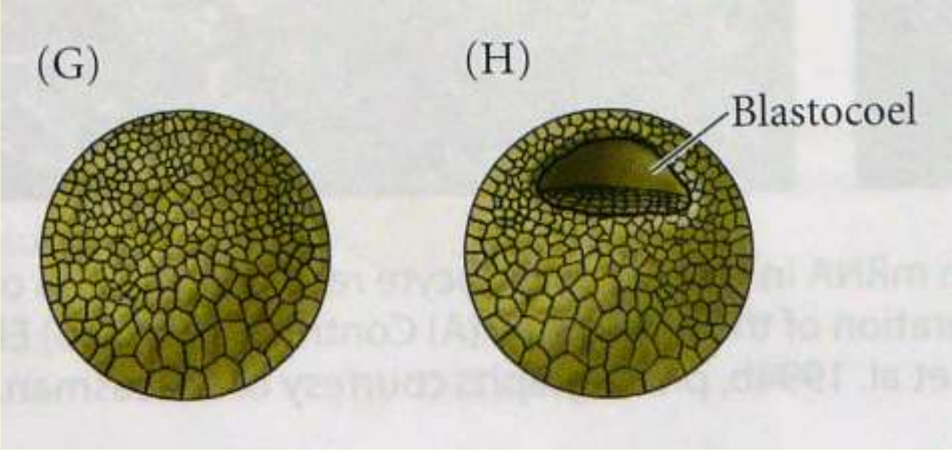


zebrafish：
Meroblasti
Cleavage
(偏裂)

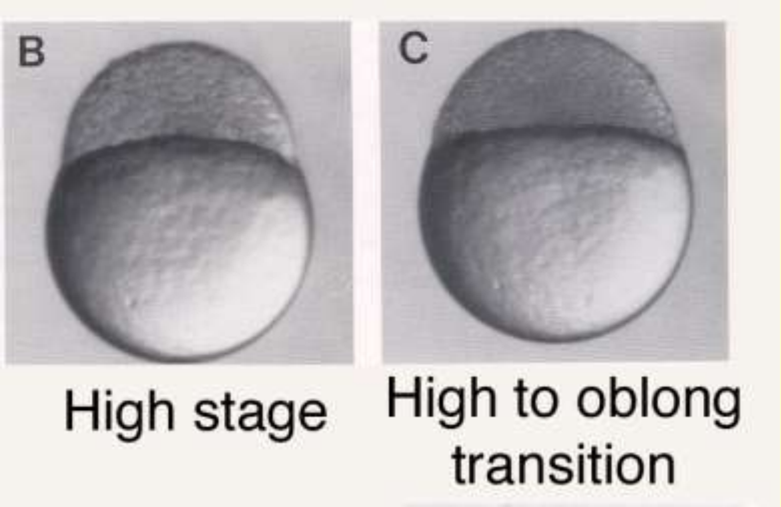


blastula (囊胚期)

xenopus



zebrafish



- MBT：mid-blastula transition (maternal→zygotic)

outline

- Fertilization (受精)
- Cleavage and blastula stage (卵裂期和囊胚期)
- Gastrulation (原肠胚期)

1）Cell migrtion (细胞运动)

2）Mesoderm induction (中胚层诱导)

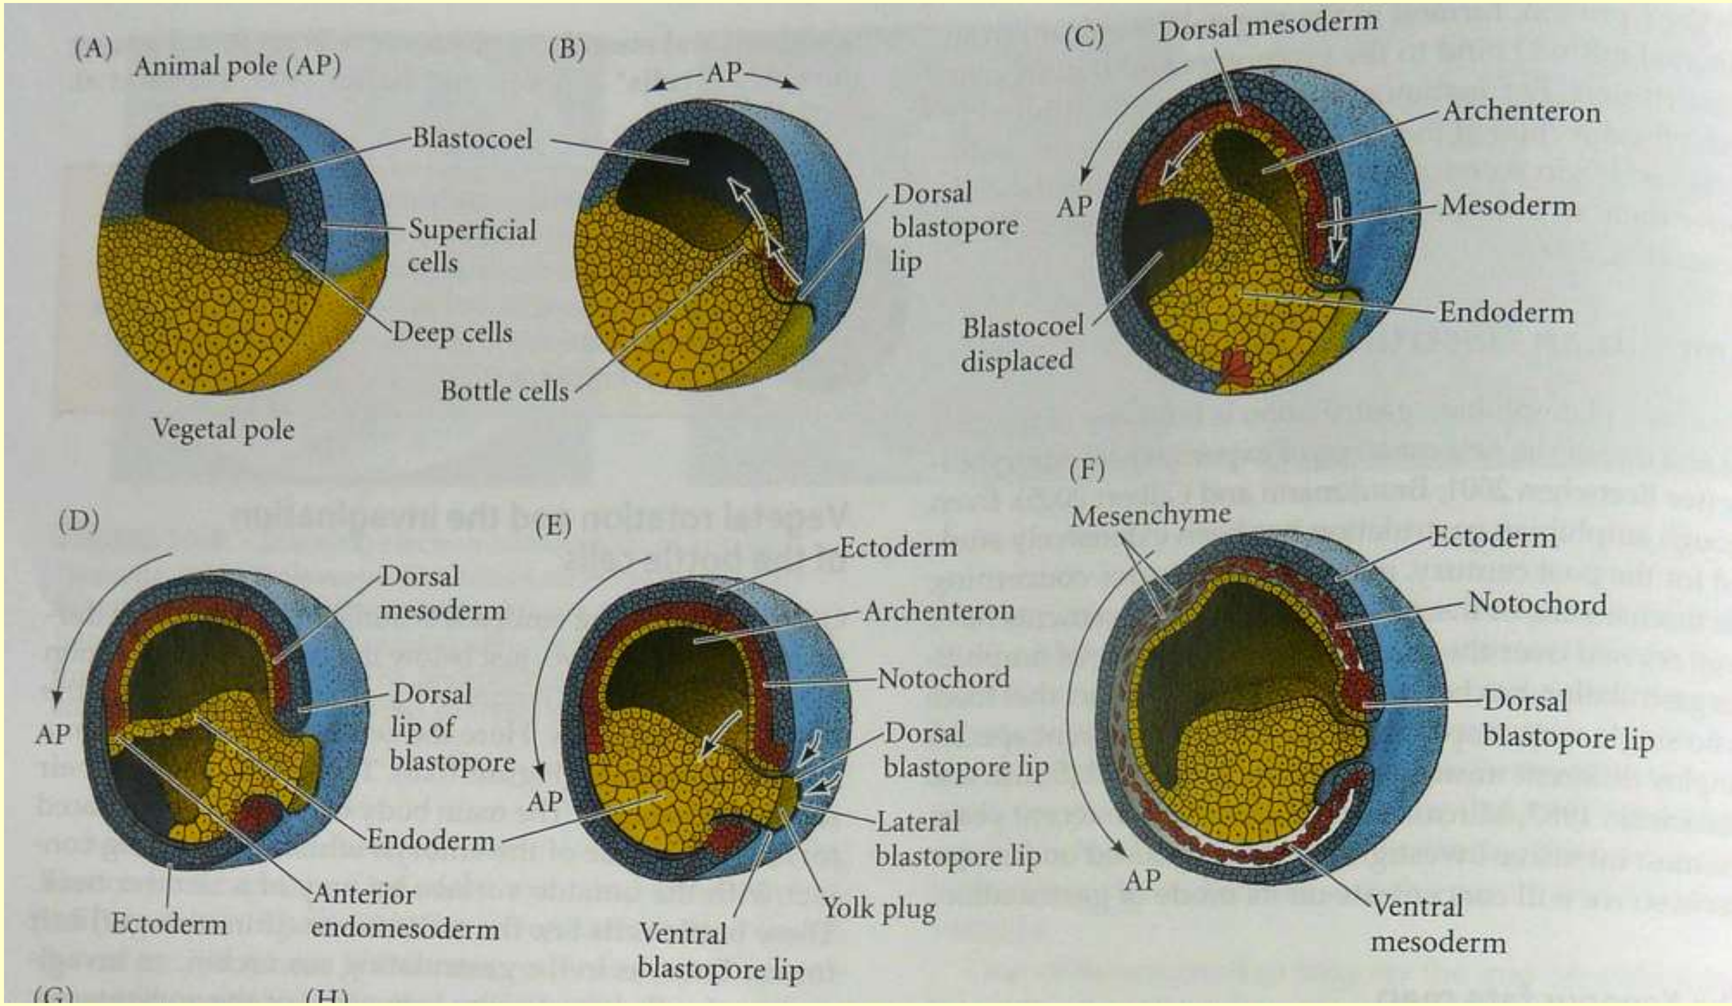
3）Specifying body axis(胚轴分化)

gastrula (原肠胚期)

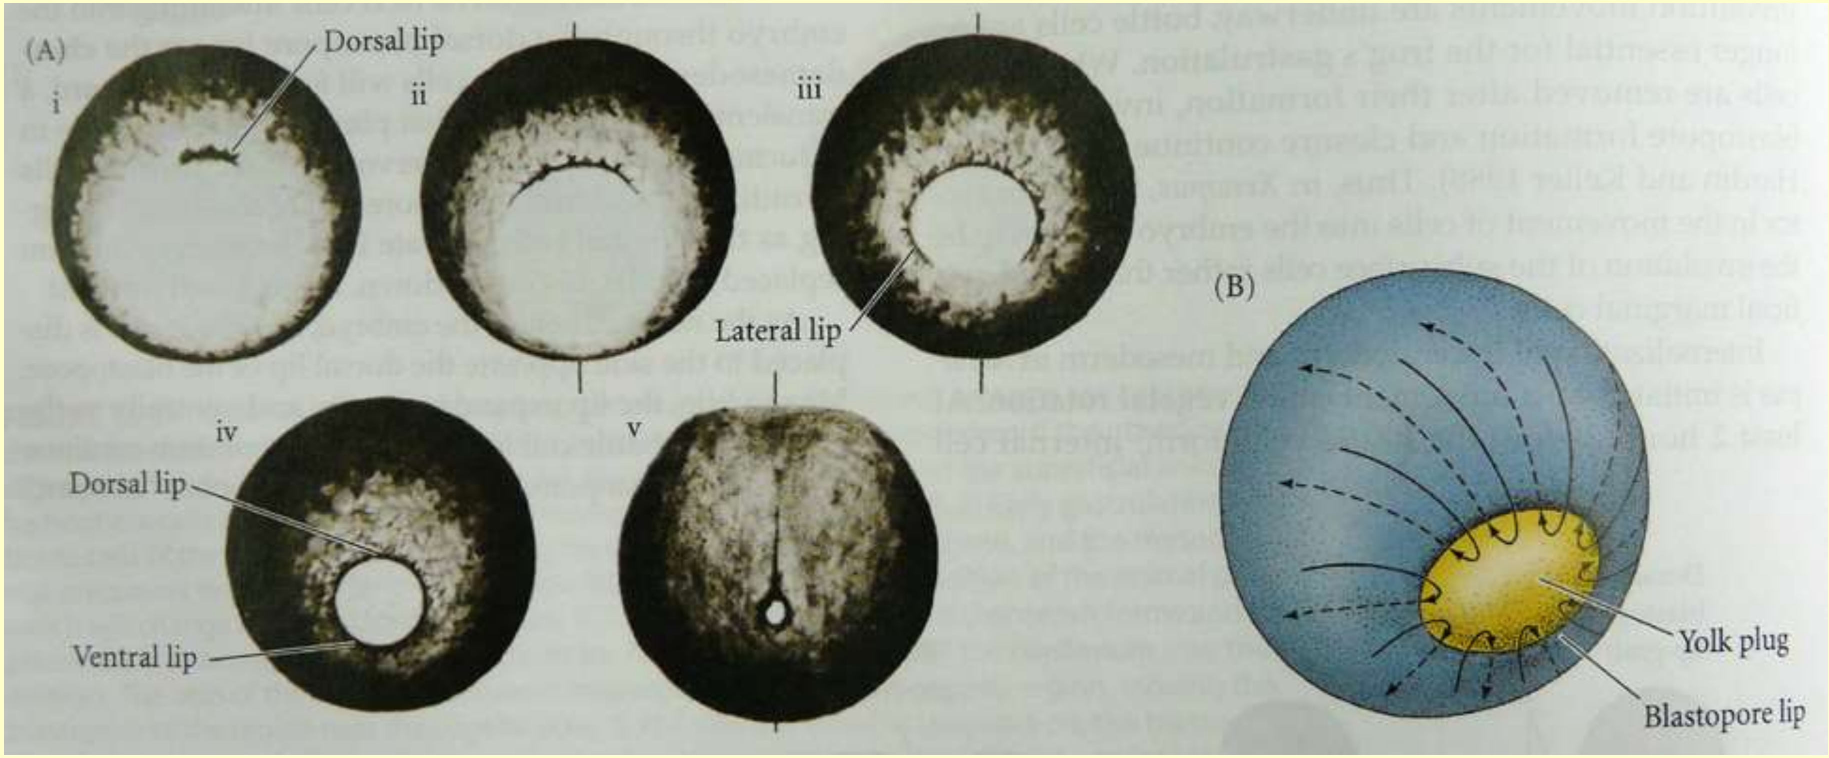
Gastrulation in xenopus
(爪蟾的原肠运动)

Gastrulation in zebrafish
(斑马鱼的原肠运动)

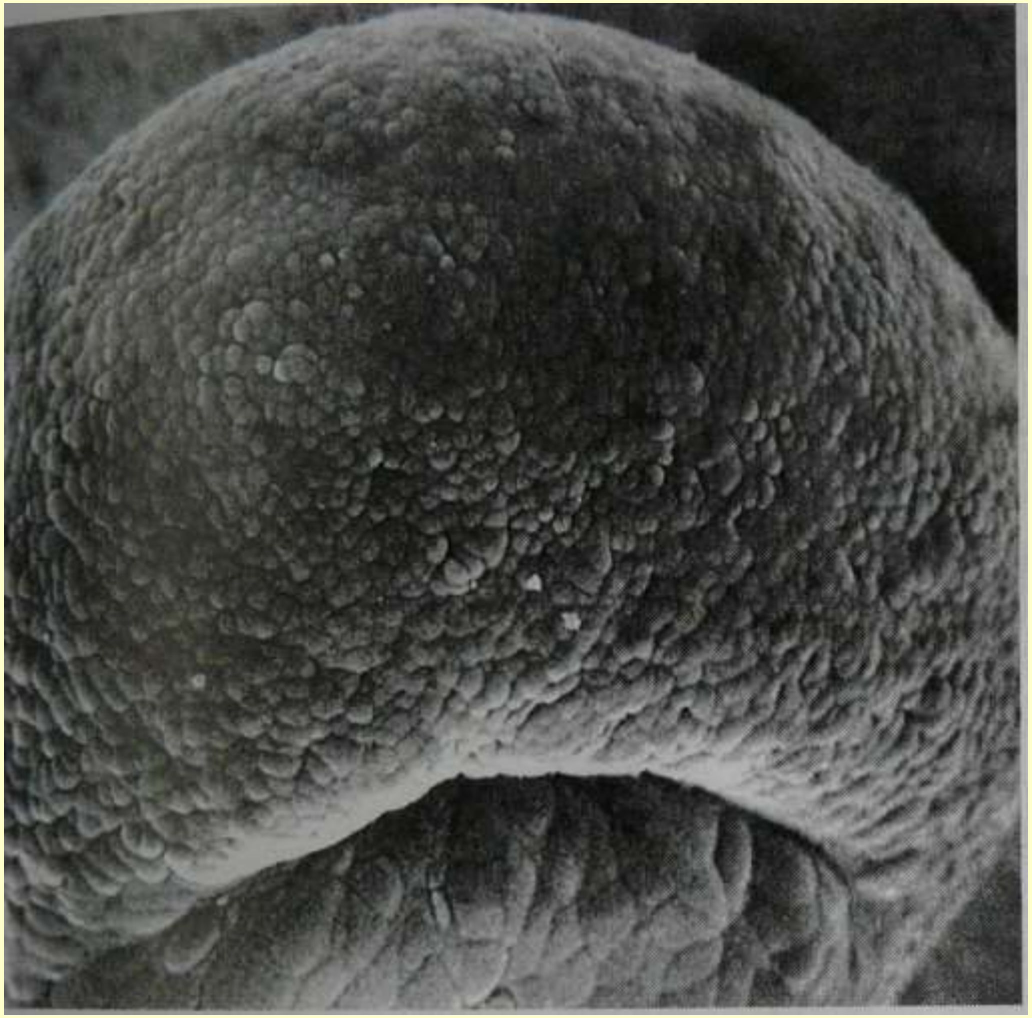
Cell migration during gastrula: epigoly (外包), involution (内卷)



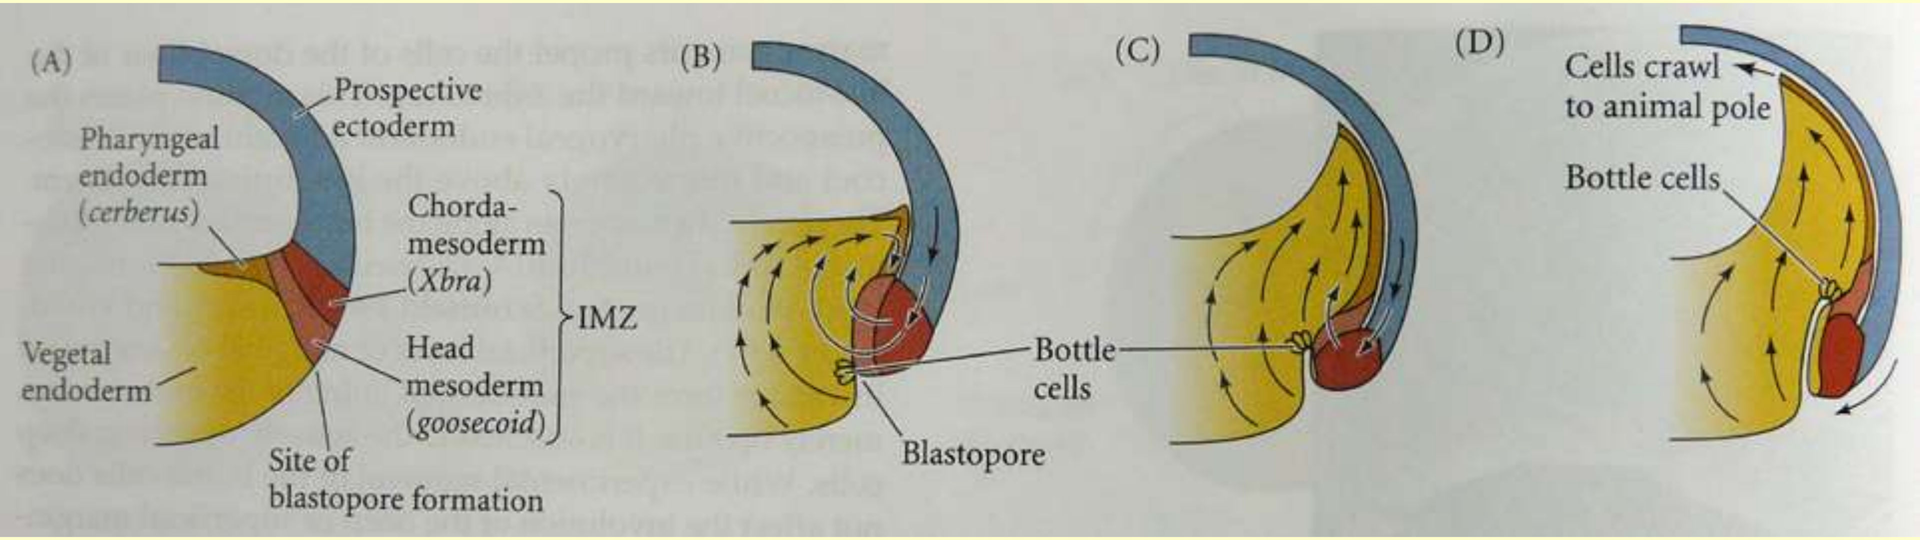
epiboly（外包）initiates at dorsal lip



dorsal lip （背唇）

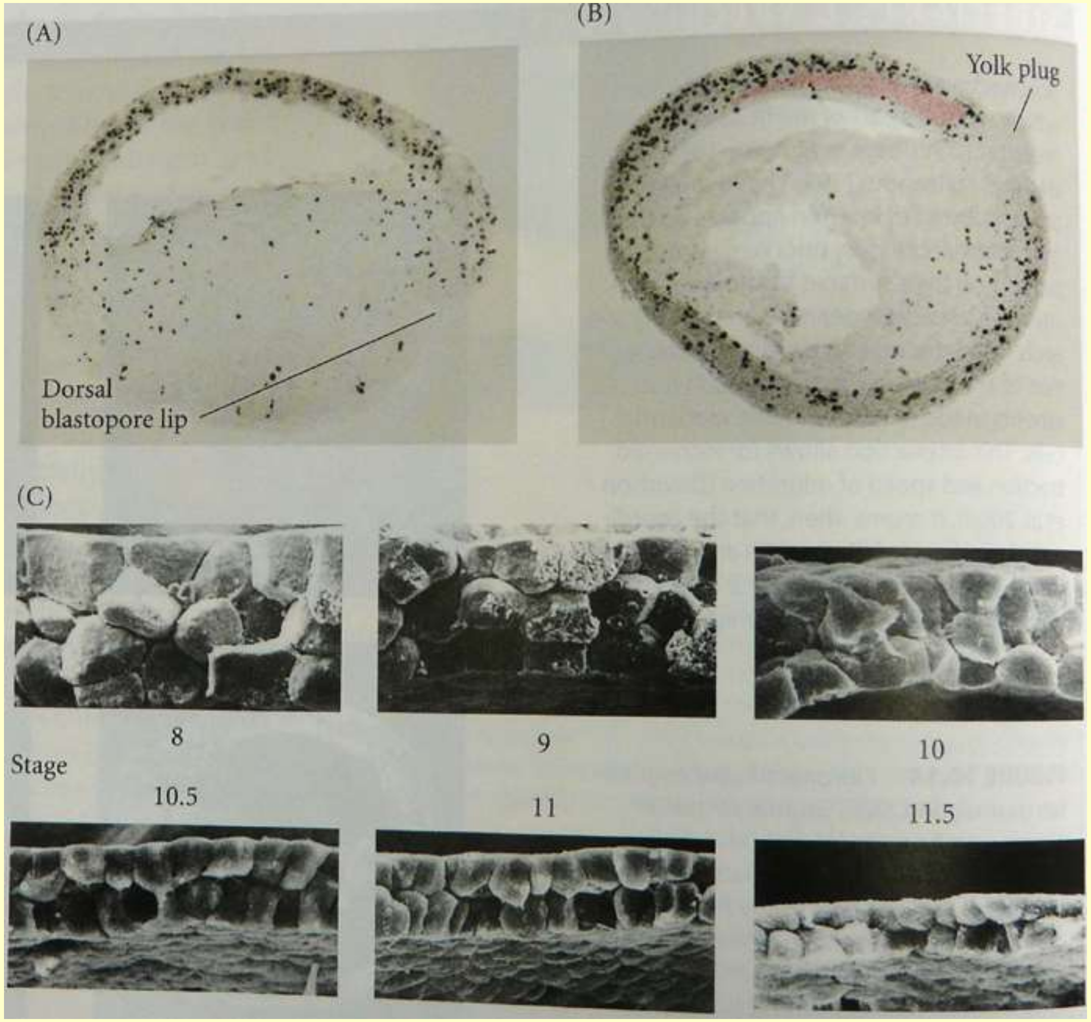


Bottle cells are important for epiboly



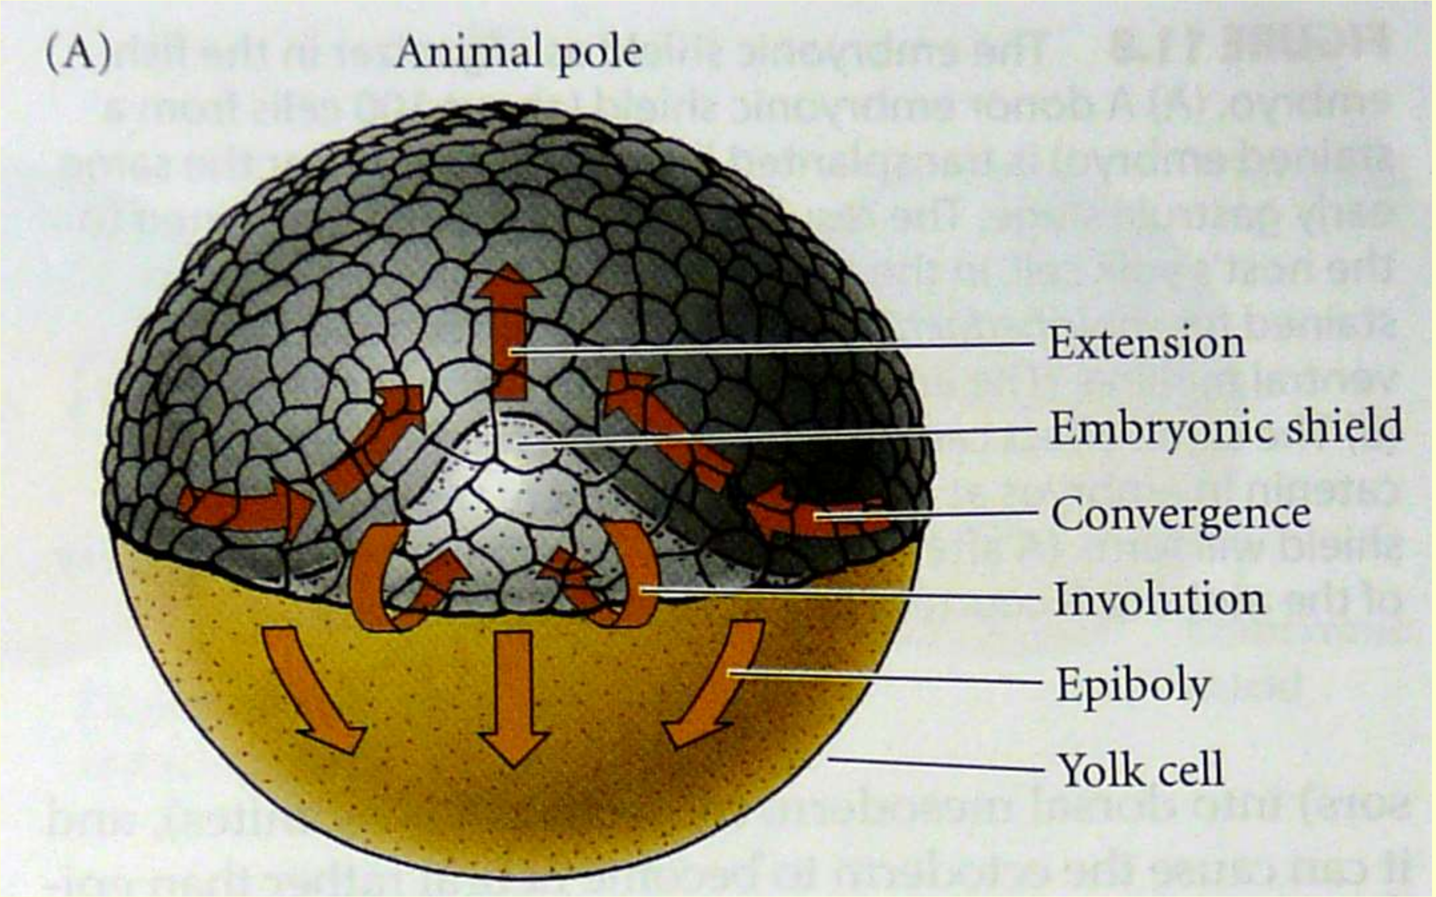
瓶颈细胞对于外包过程非常重要

Epiboly is accomplished by cell division and intercalation



外包机制：
细胞分裂
相互置入

Cell movement during zebrafish epiboly



汇聚延伸

Summary (I)

Key words:

- Grey crescent (灰色新月区),
- Cleavage and blastula (卵裂期和囊胚期),
- Gastrulation (原肠运动)

Event:

- Fertilization
- Cleavage and blastula
- Cell migration during gastrulation

outline

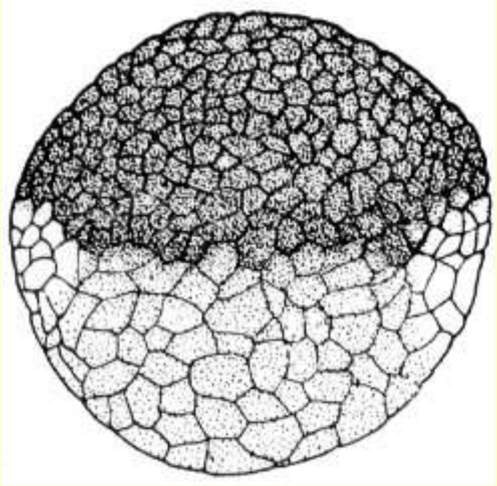
- Fertilization (受精)
- Cleavage and blastula stage (卵裂期和囊胚期)
- Gastrulation (原肠胚期)

1）Cell migrtion (细胞运动)

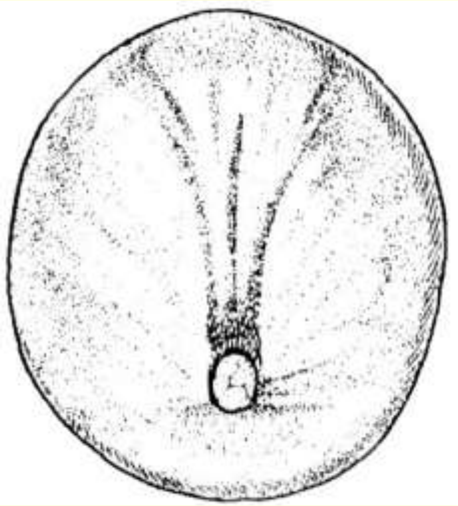
2）Mesoderm induction (中胚层诱导)

3）Specifying body axis(胚轴分化)

body axis formation



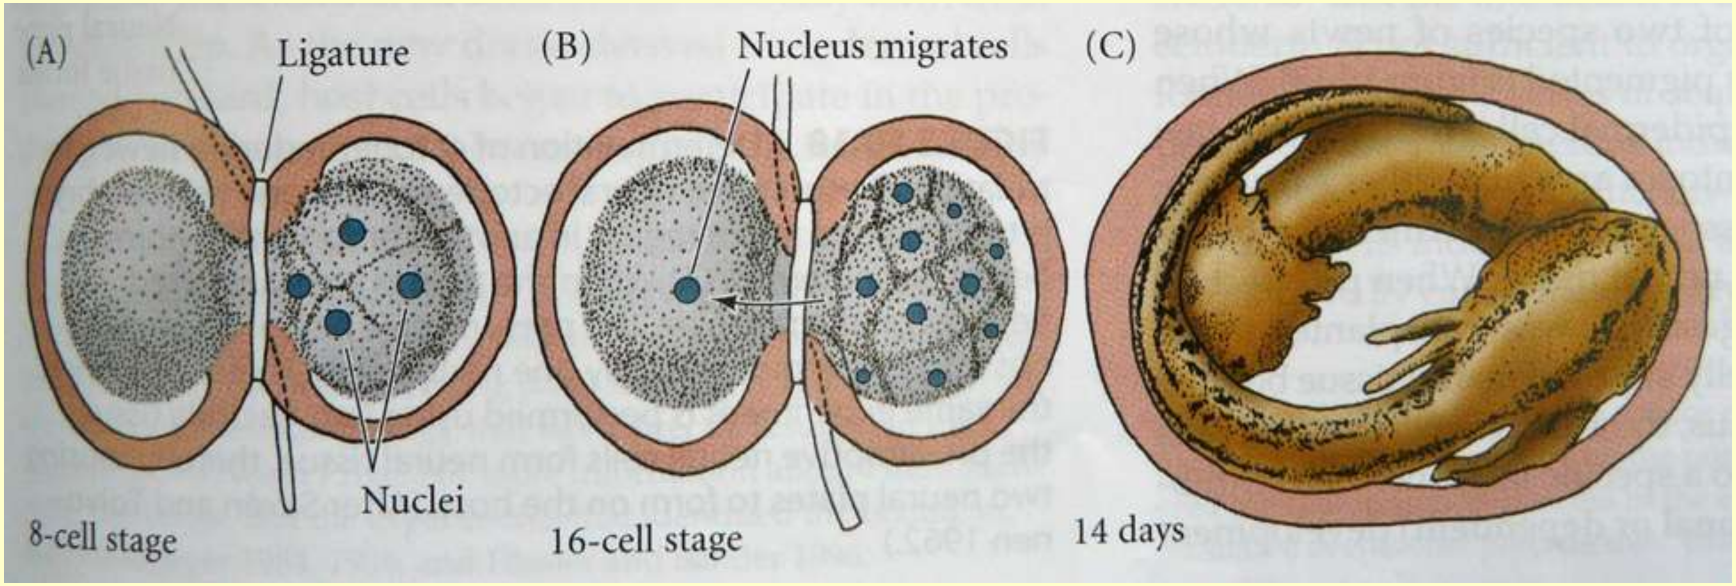
St. 8



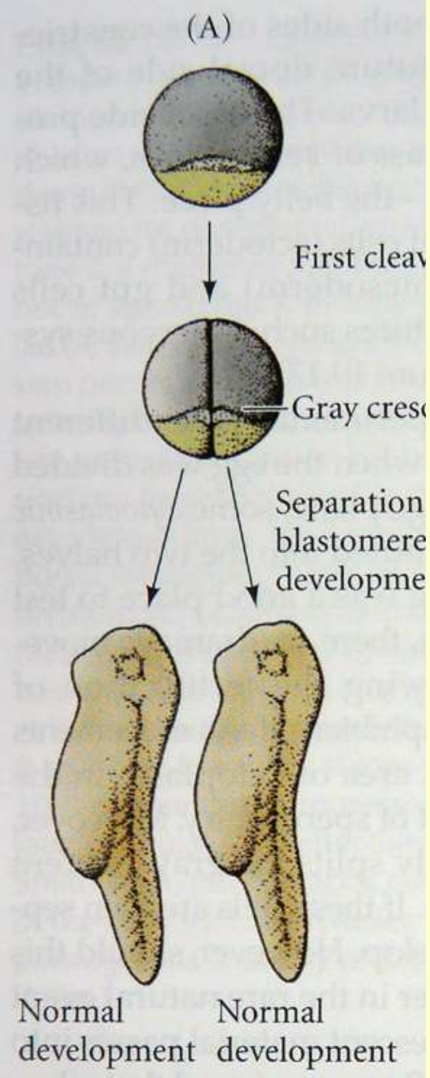
St. 12.5

- Anterior-posterior patterning (前后分化)
- Dorso-ventral patterning (背腹分化)
- Left-right patterning (左右分化)

Spemann's demonstration of nuclear equivalence in newt (蠑螈) cleavage



But…



Grey crescent is very important for dorsalization

Hans Spemann and Hilde Mangold: primary embryonic induction

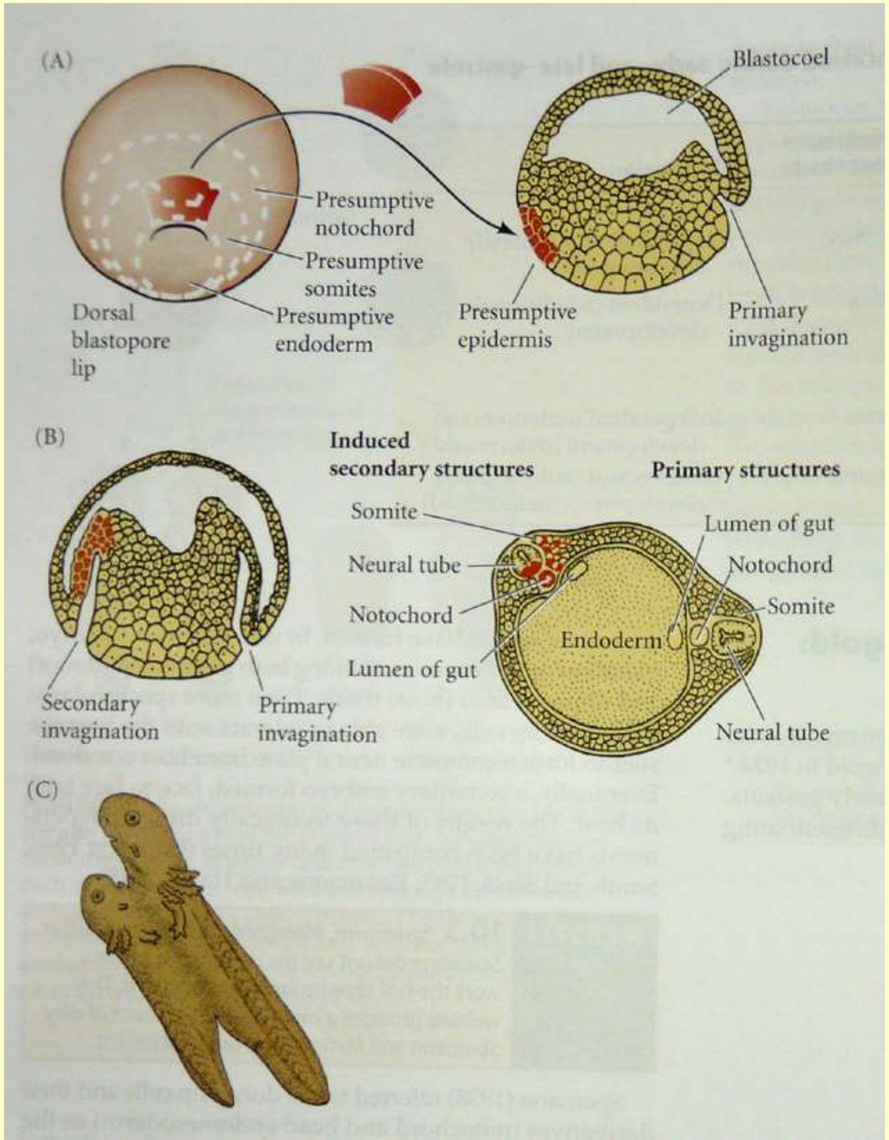


FIGURE 10.19 Organization of a secondary axis by dorsal blastopore lip tissue. (A) Dorsal lip tissue from an early gastrula is transplanted into another early gastrula in the region that normally becomes ventral epidermis. (B) The donor tissue invaginates and forms a second archenteron, and then a second embryonic axis. Both donor and host tissues are seen in the new neural tube, notochord, and somites. (C) Eventually, a second embryo forms that is joined to the host. (After Hamburger 1988.)

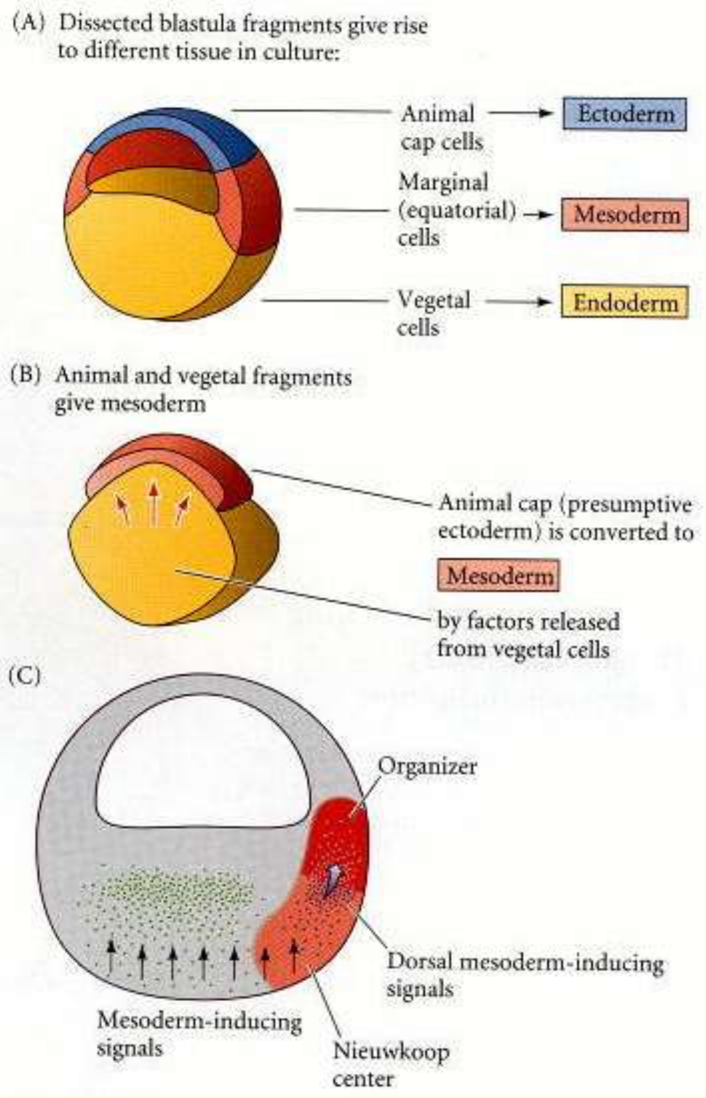
背唇组织能够诱导第二胚轴的形成，因此也称之为组织者（organizer）

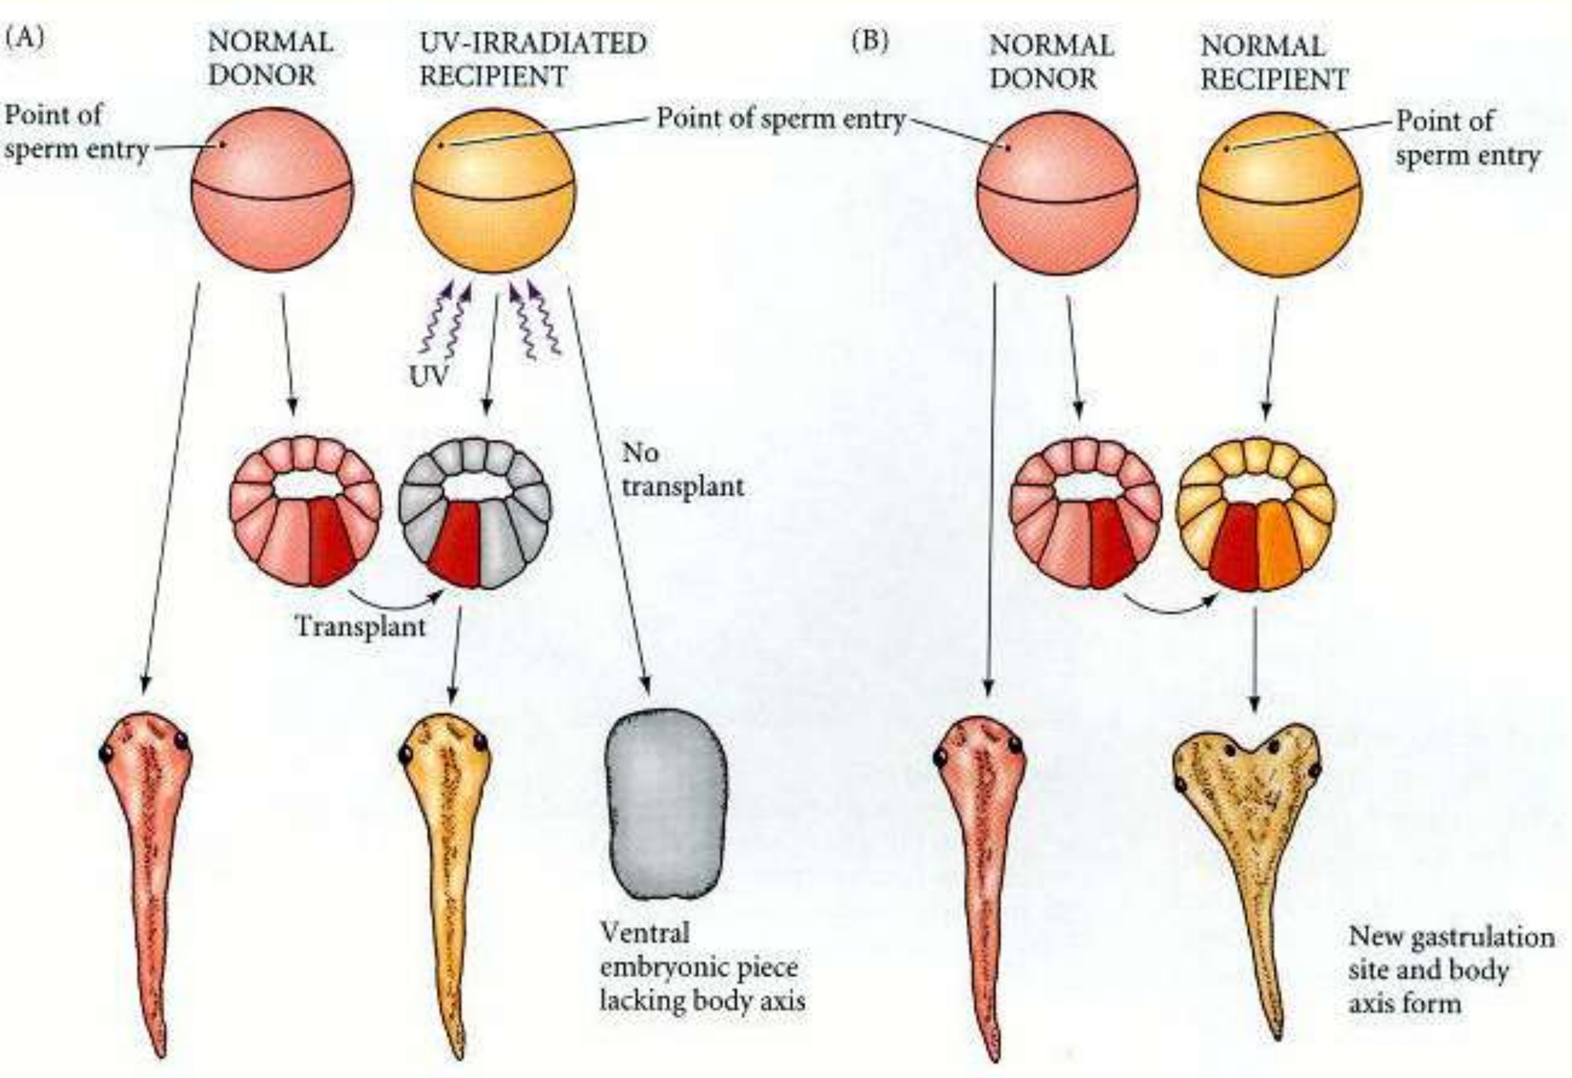
The Nobel Prize in Physiology or Medicine 1935: Hans Spemann

Organizer is induced by Nieuwkoop center

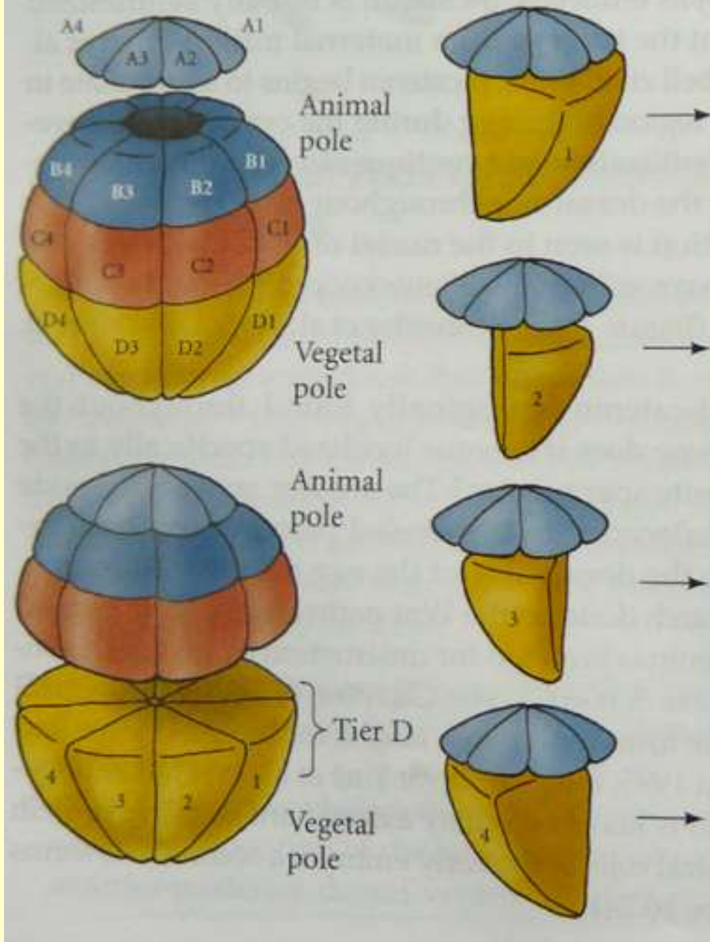


Nieuwkoop center
→ organizer

Vegetal cells are important for organizer formation



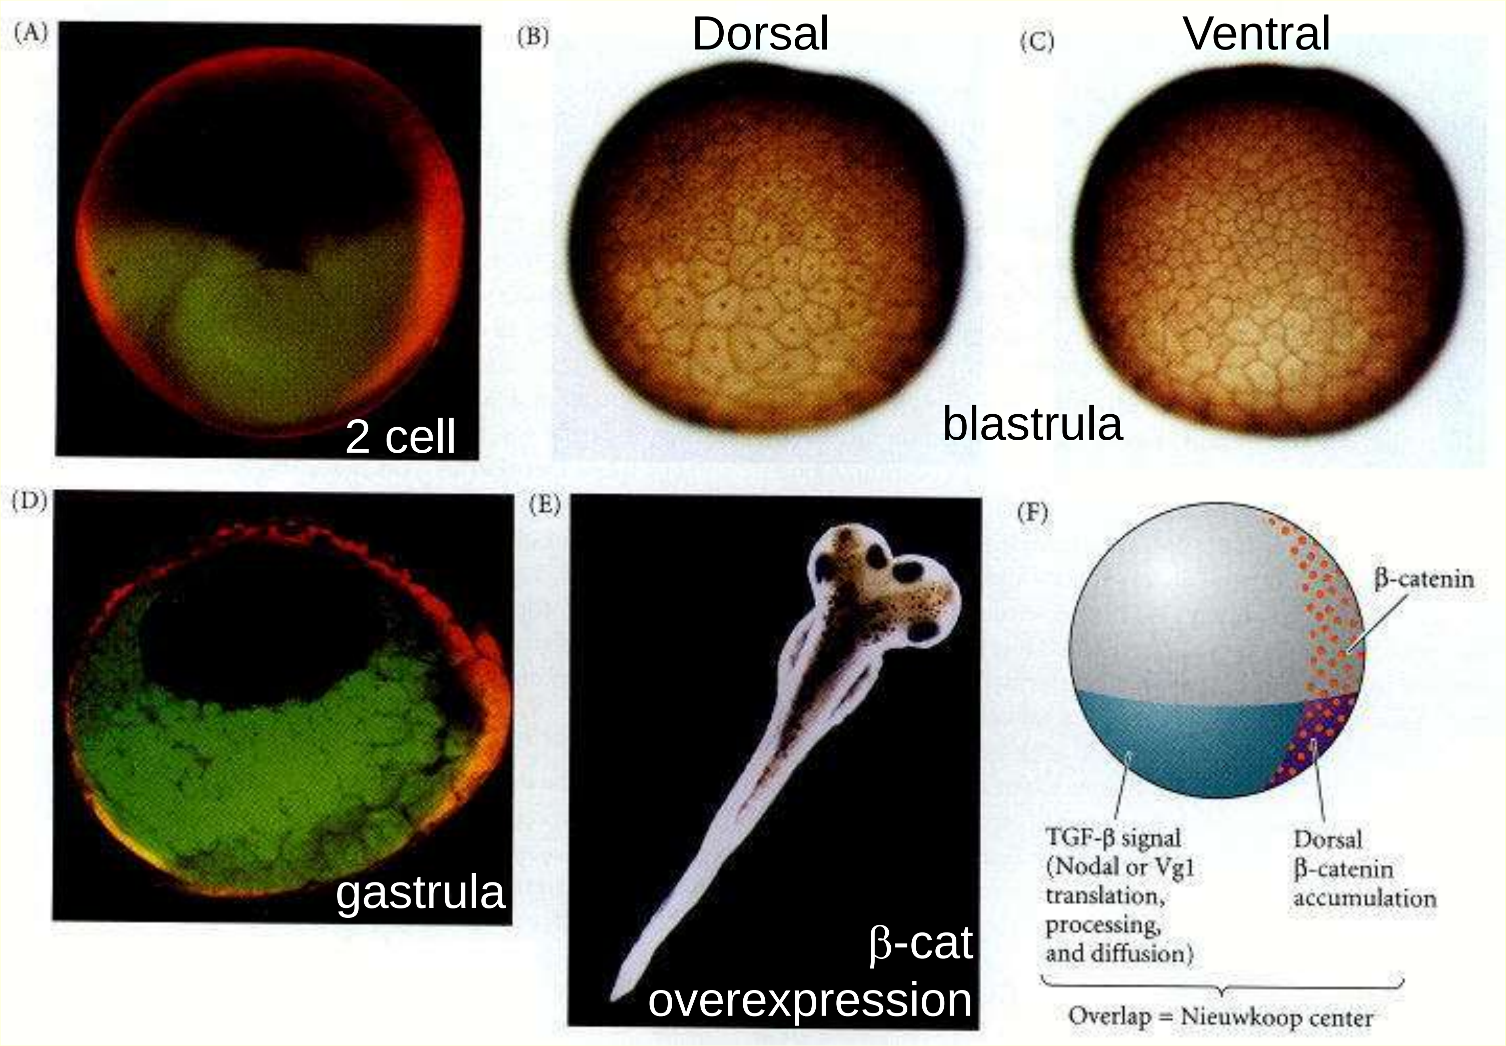
The dorsalmost vegetal blastomere induces dorsal mesoderm



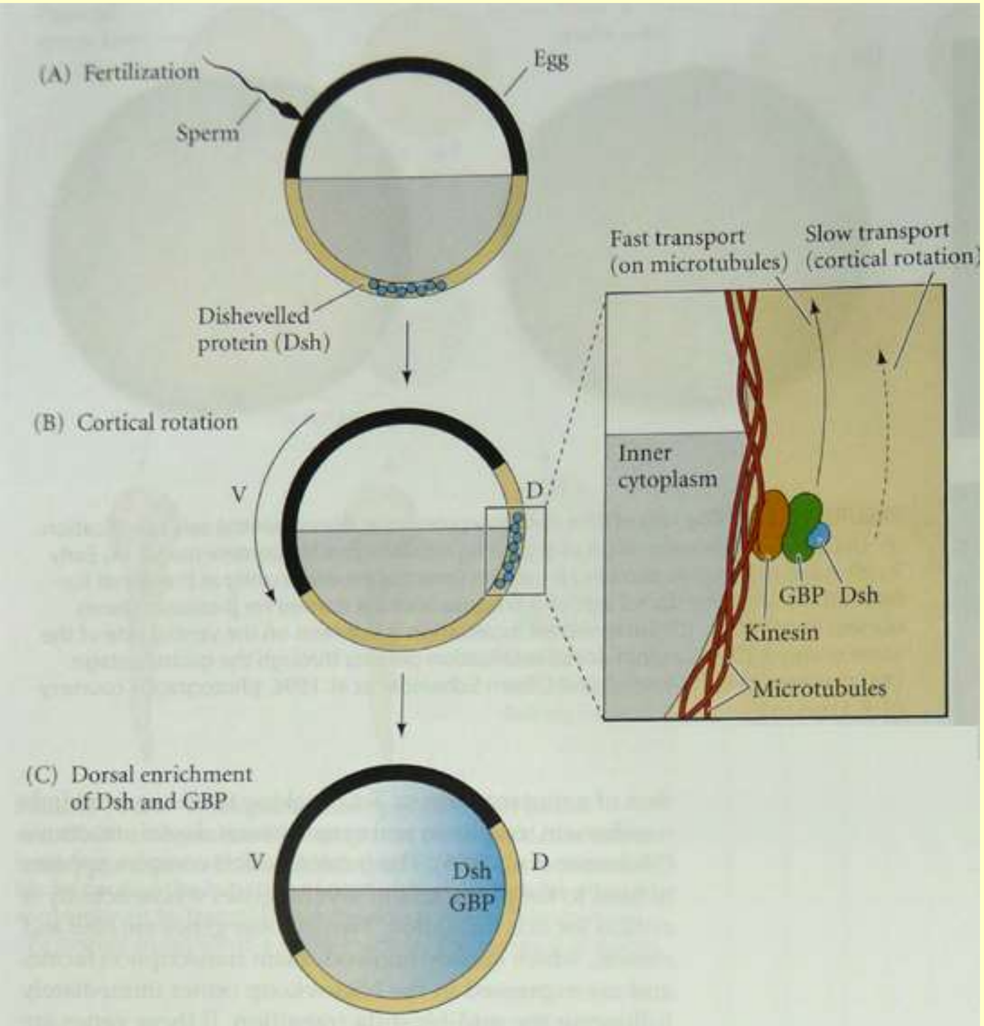
Percentage of total inductions

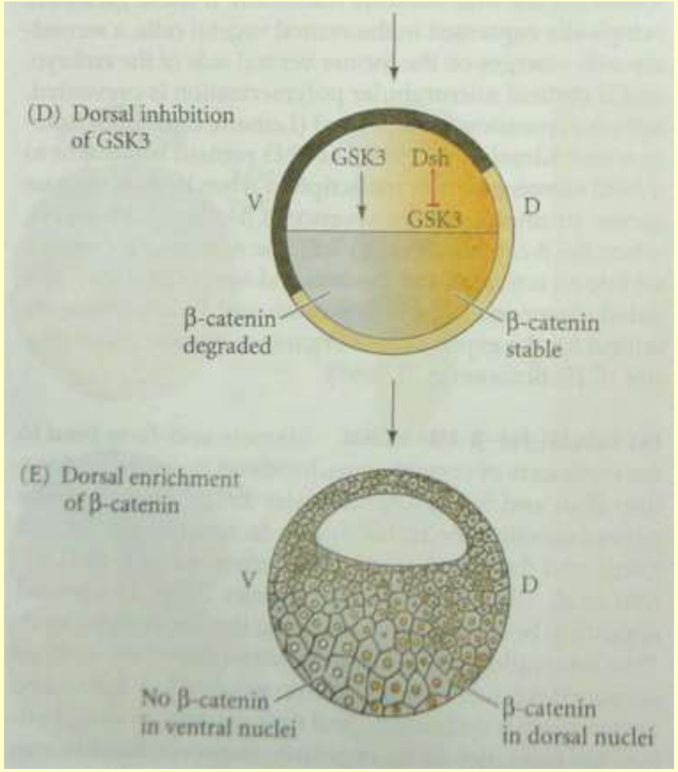
Dorsal	Intermediate	Ventral
77	23	0
11	61	28
5	45	50
16	42	42

Nieuwkoop center factor: β-catenin is important for DV patterning

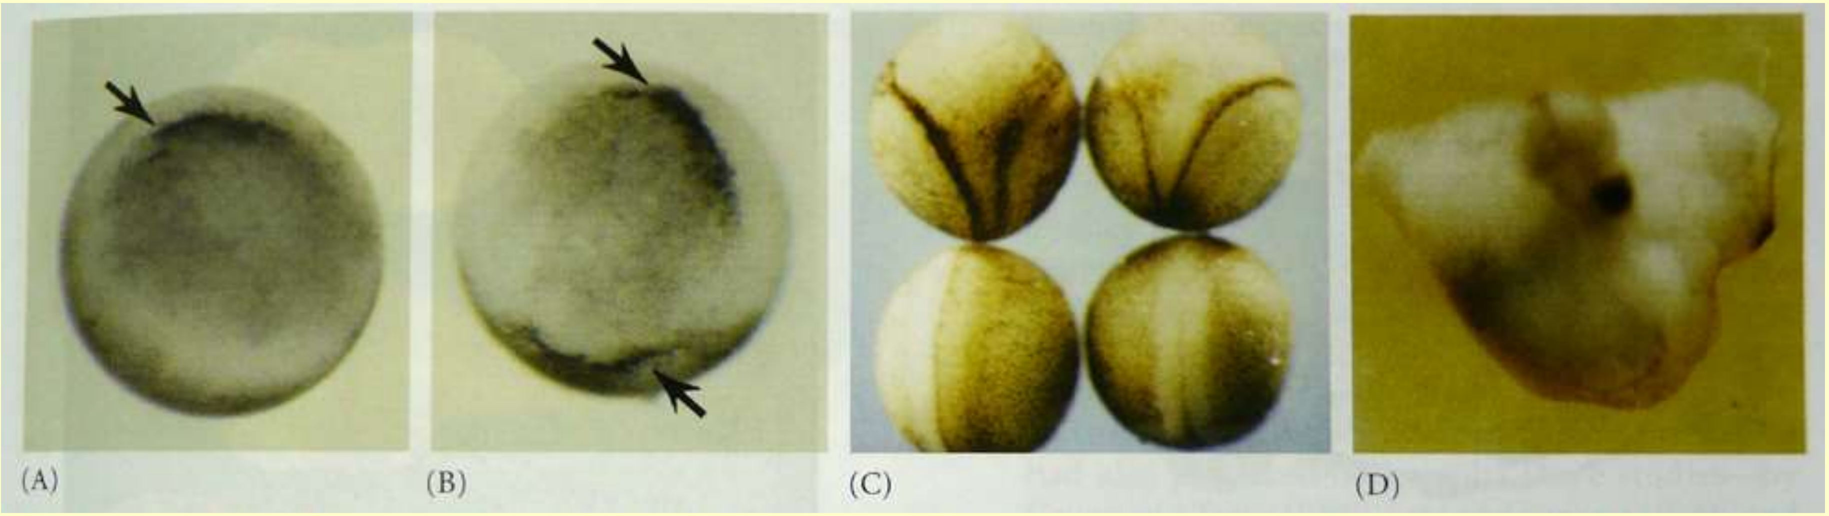


Wnt signaling and DV patterning



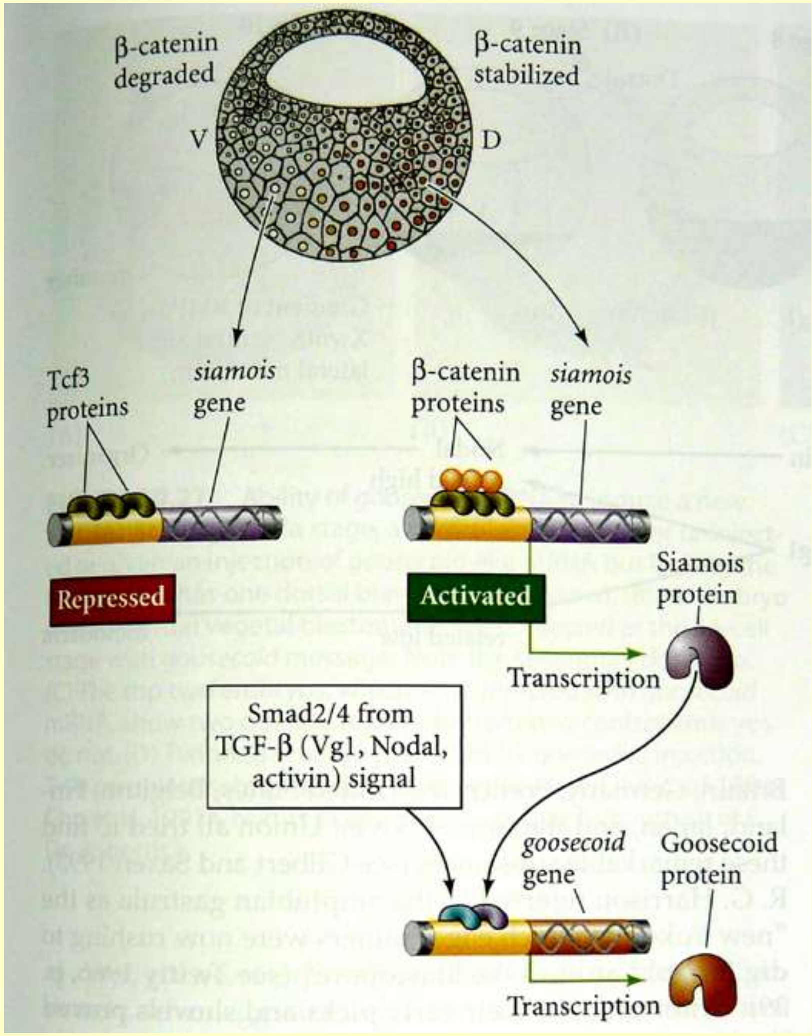


goosecoid, downstream gene of wnt pathway, can induce 2nd axis

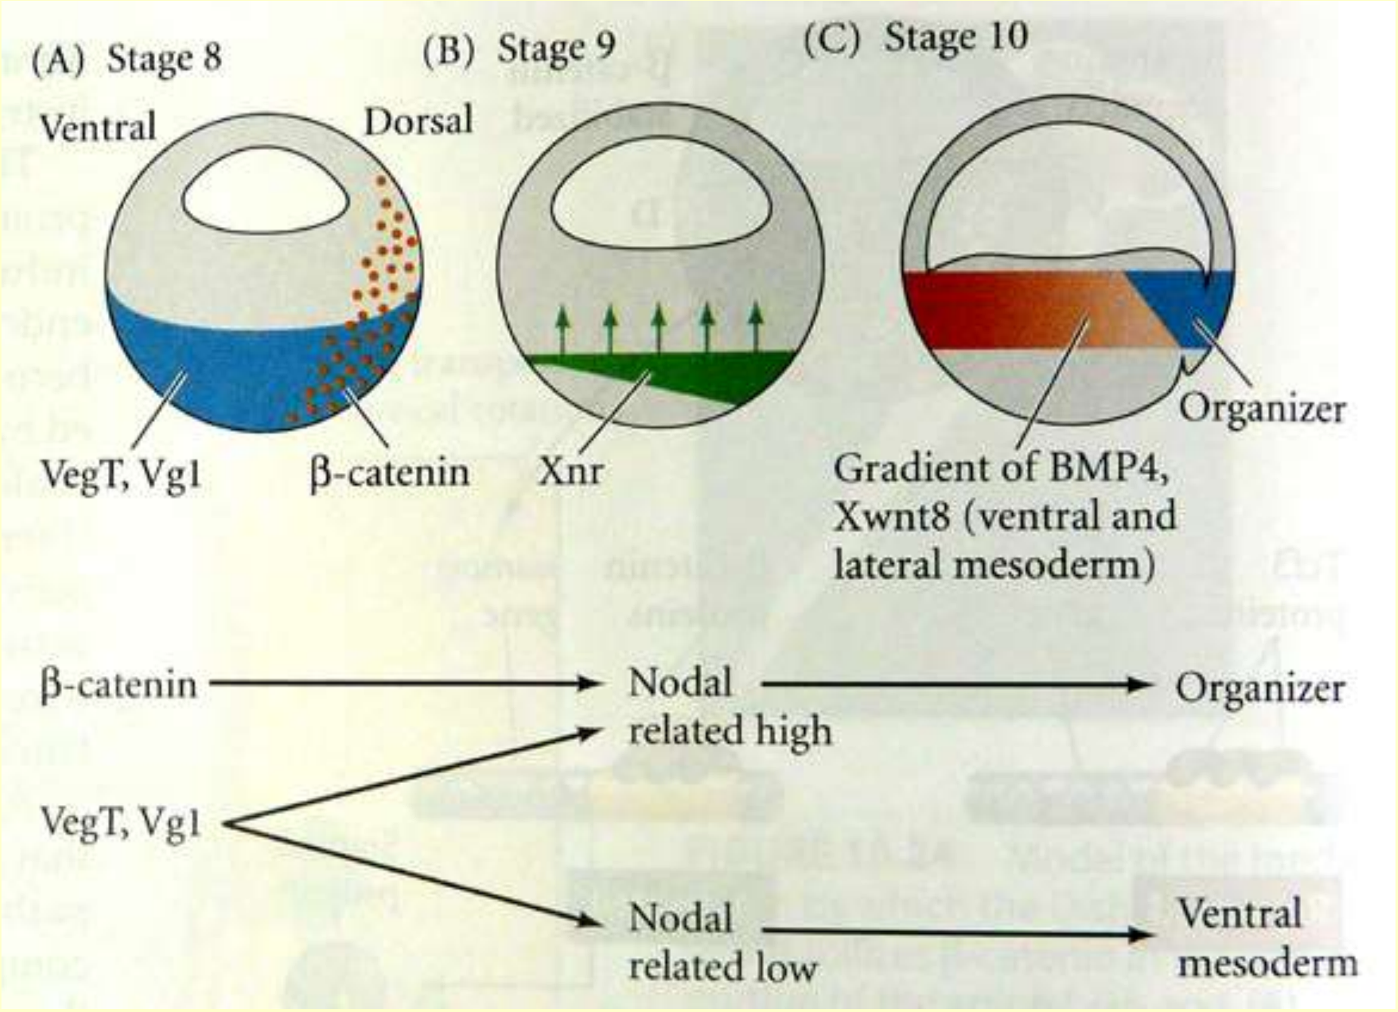


Wnt信号下游基因goosecoid能够诱导第二胚轴的形成

Hypothesis for organizer (dorsal mesoderm) induction



Model for mesoderm induction and organizer formation



How does organizer direct DV patterning (induce neural ectoderm)?

(组织中心者如何在背腹分化中起作用？)

Working strategy

Some molecular?

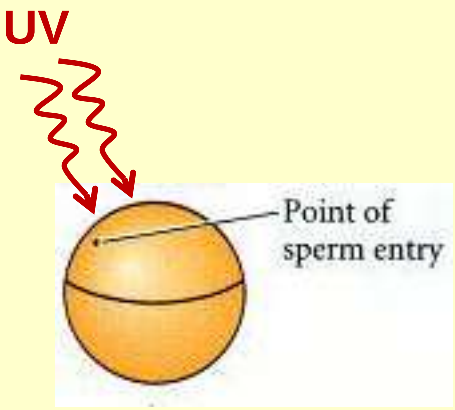
↓

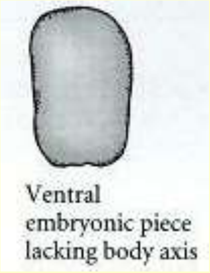
UV treated embryos

↓ Rescued (回复)

Yes → Dorsalizing factor

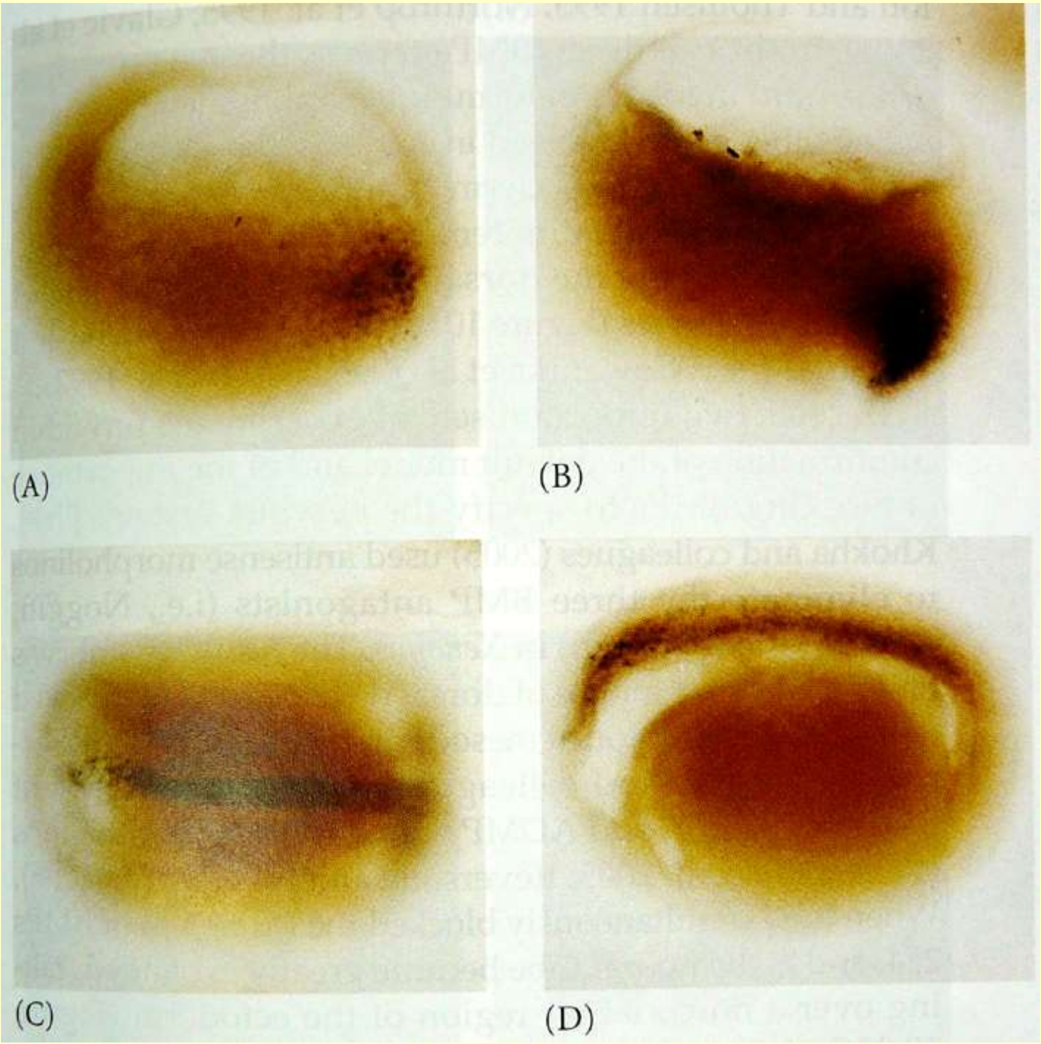
No → Not interested



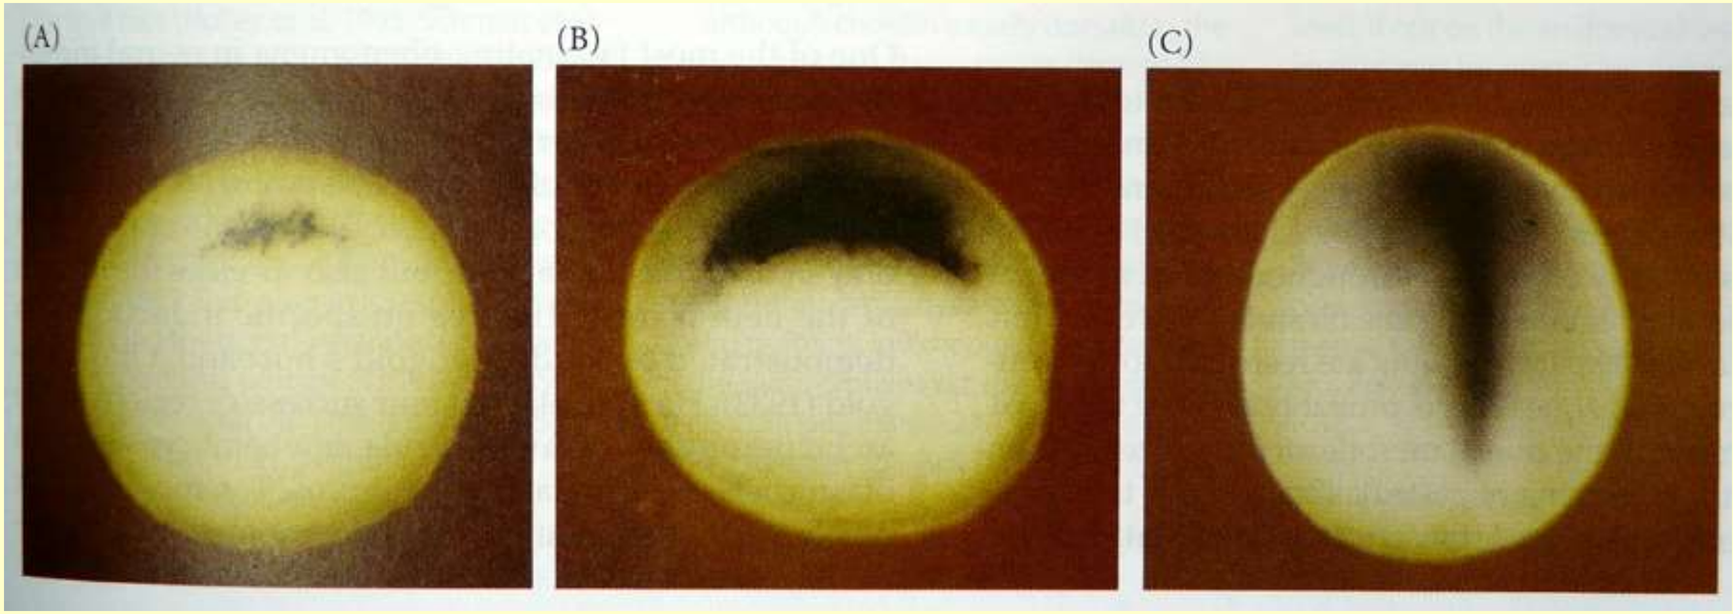


Dosalizing factor: noggin

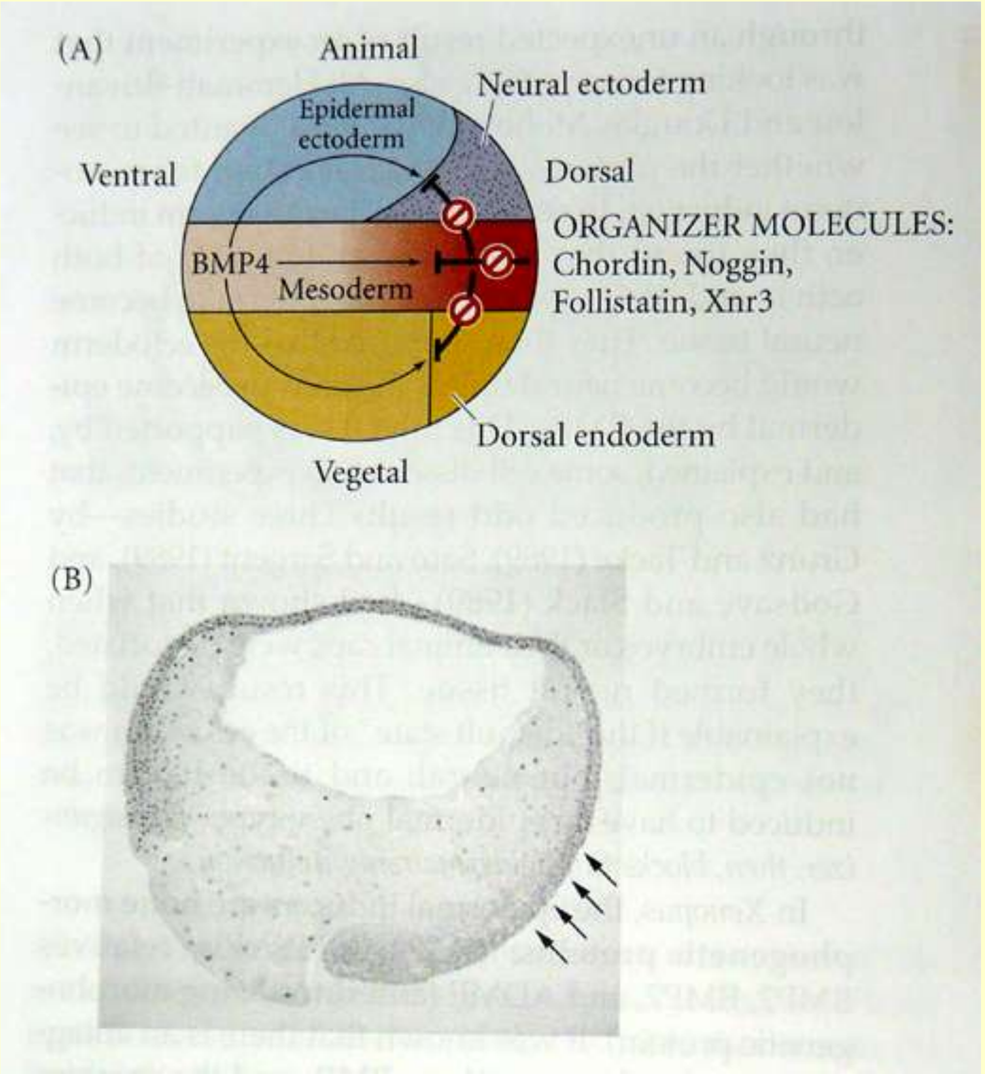
Dosalizing factor noggin is localized to the dorsal side of the embryo



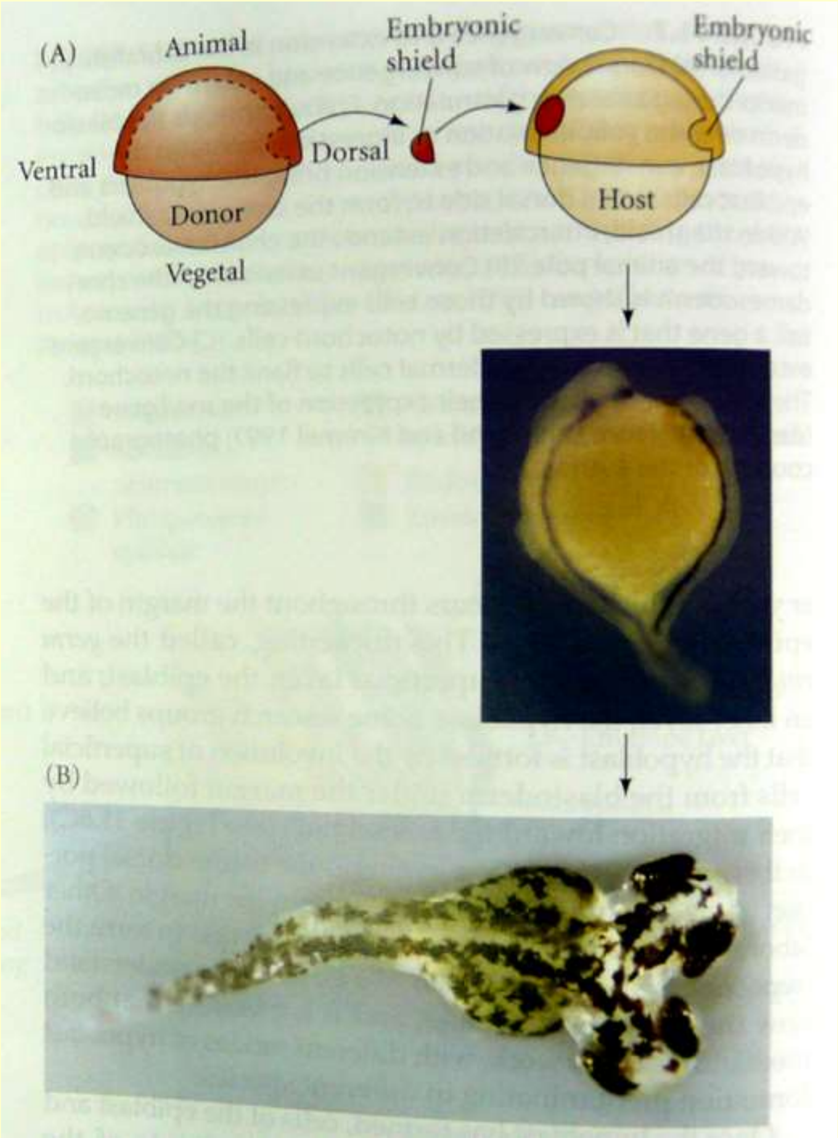
Dosalizing factor: chordin



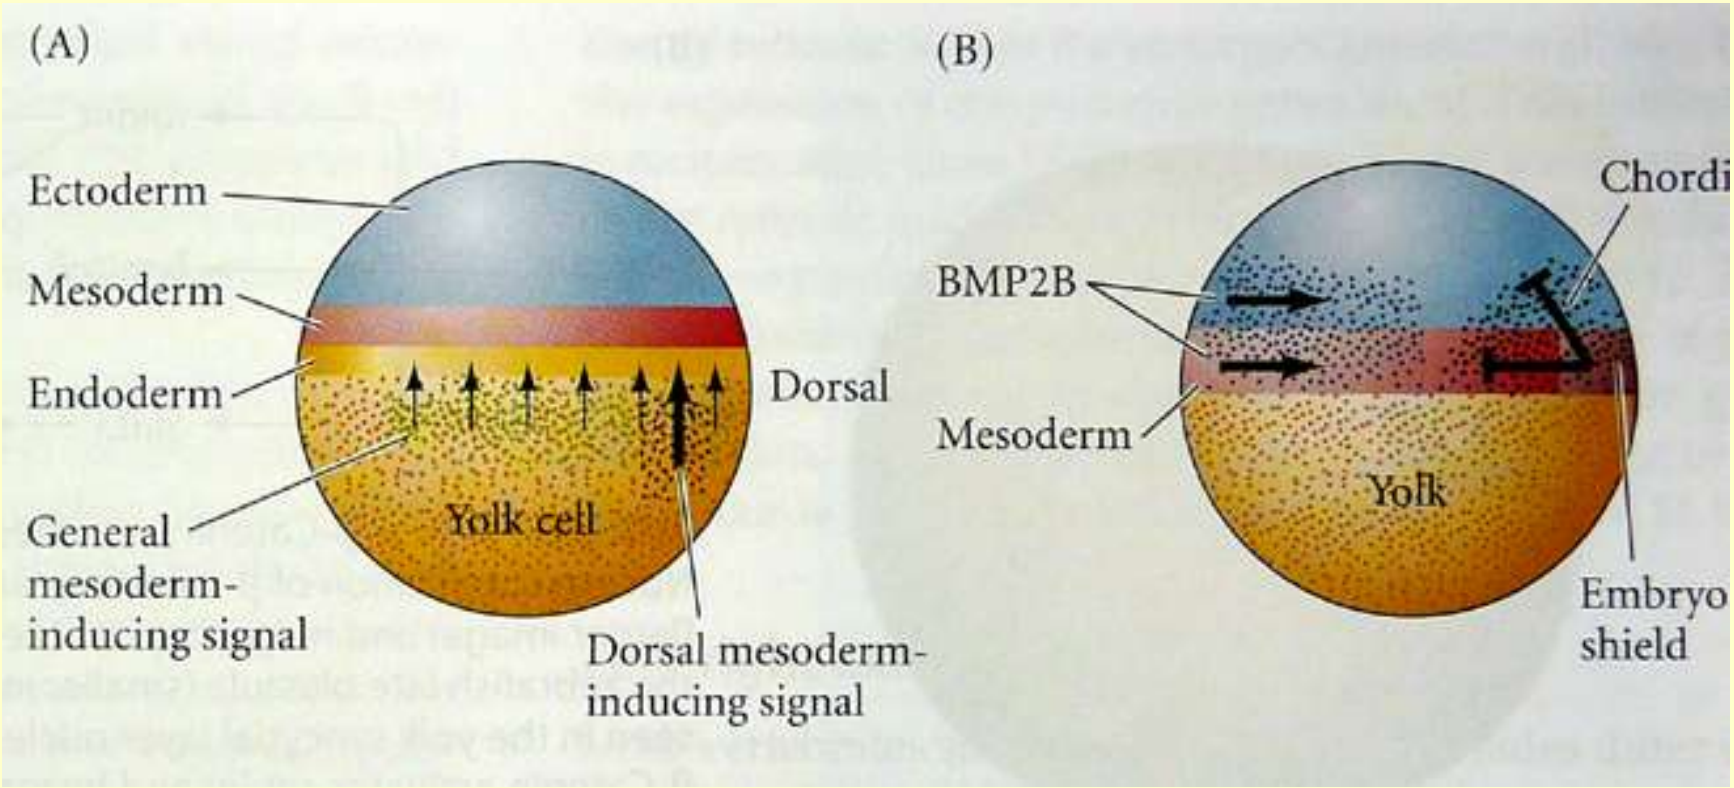
Mechanism of organizer's function in DV patterning



DV patterning in zebrafish embryonic development



Mechanism of DV patterning in zebrafish

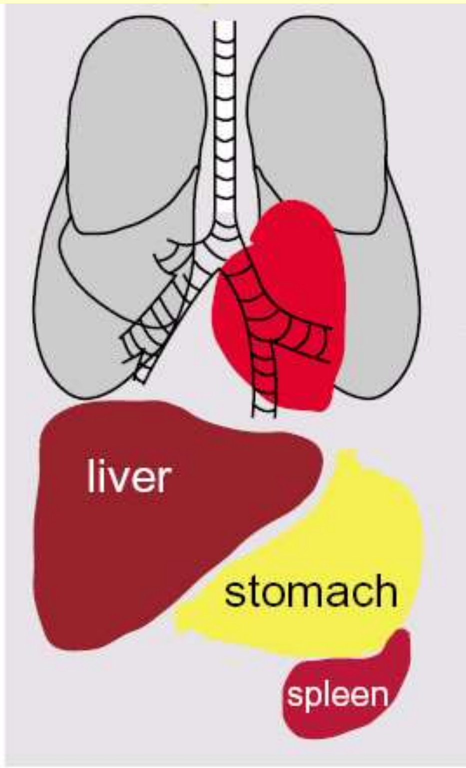


Summary (II)

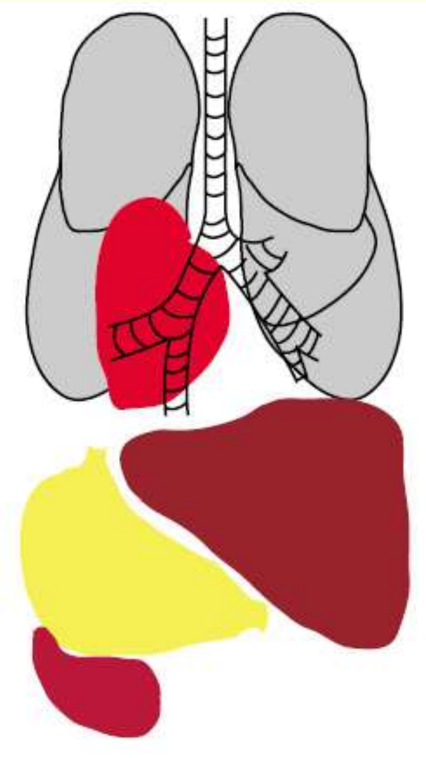
Key words:

- mesoderm induction (中胚层诱导)
- organizer (组织者)
- Dorso-ventral patterning (背腹分化)
- Morphogen (形态素)
- Cell signaling(信号通路): BMP, Nodal, Wnt

LR defect and human disease



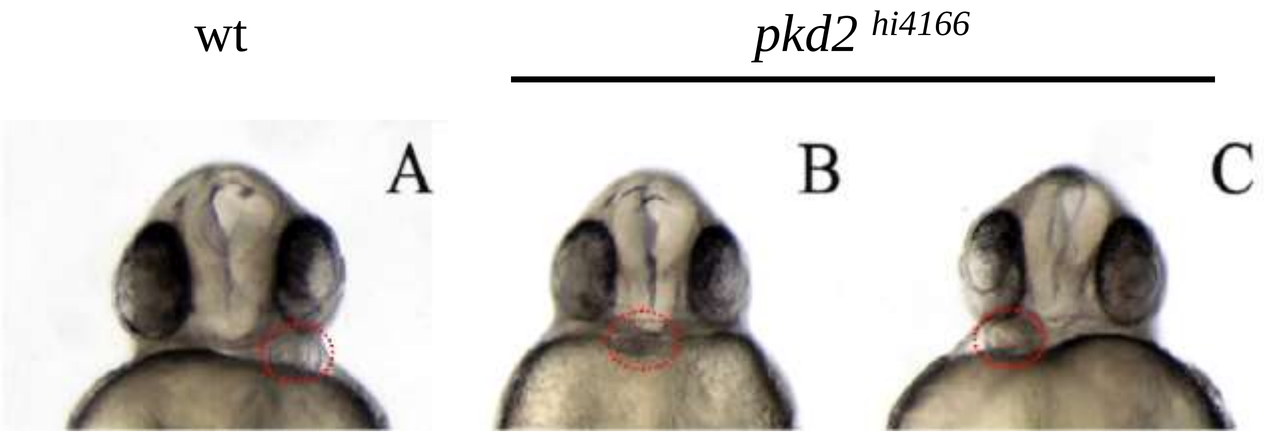
Normal–*situs solitus*



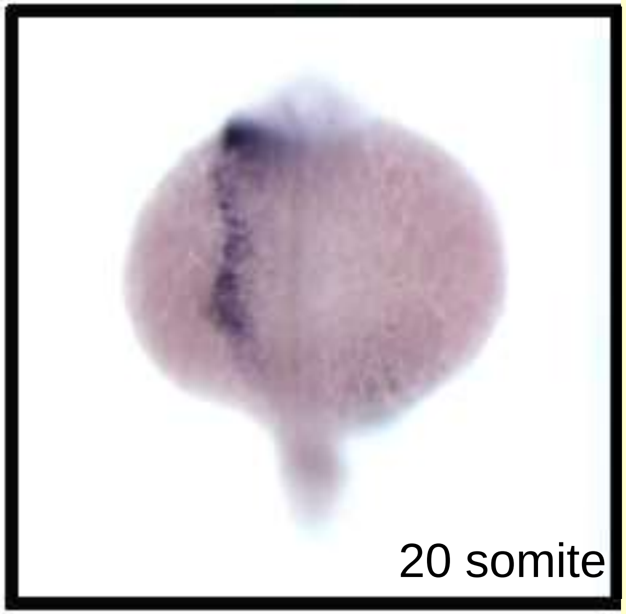
Situs inversus

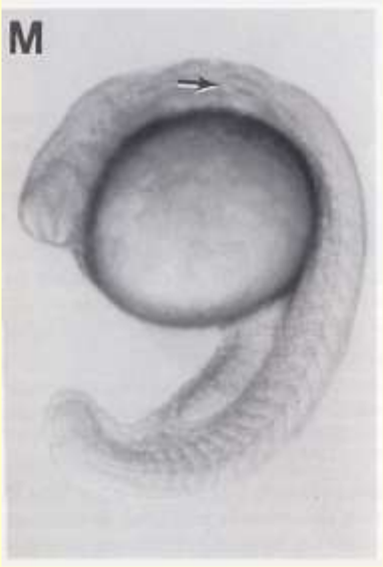
McGrath, 2003

LR patterning



LR patterning is controlled by nodal signaling

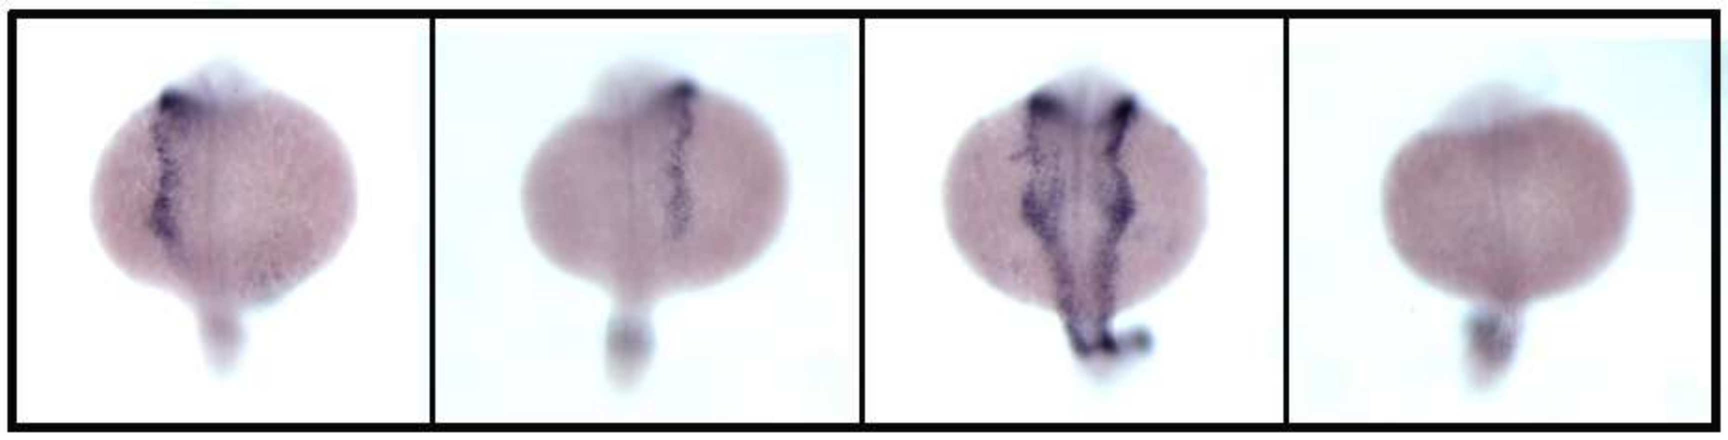




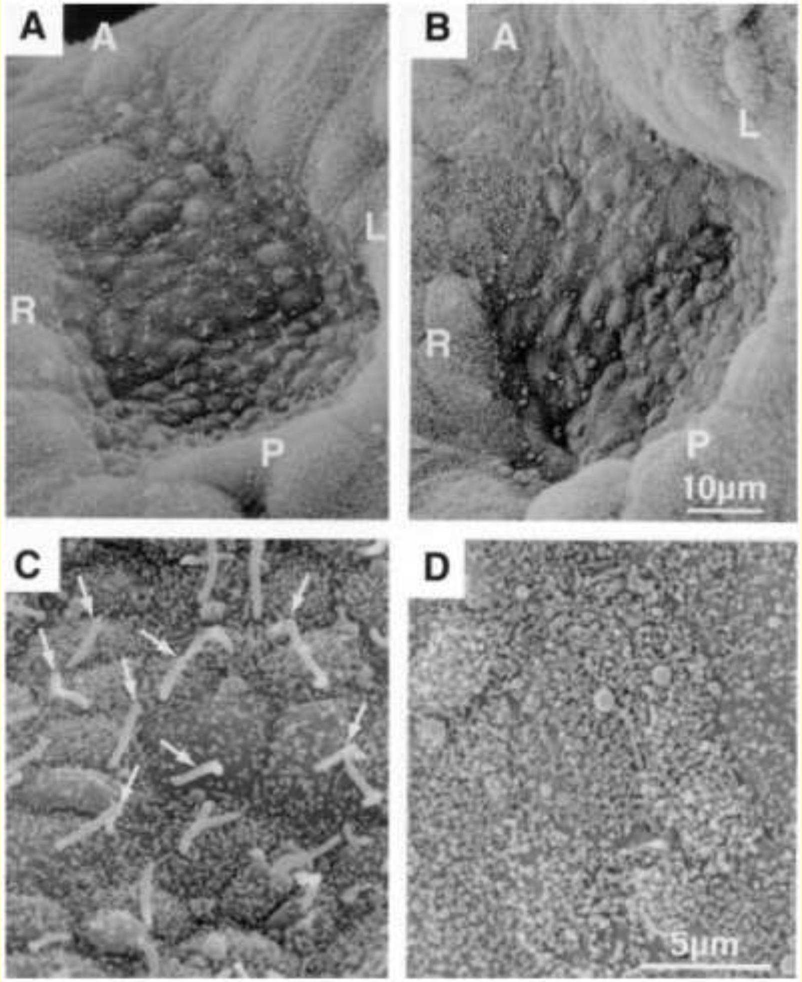
Southpaw, one Nodal related gene,
expresses on left side of zebrafish embryos

spaw expression is radomized in LR mutant

wt	$pkd2^{hi4166}$



Absence of the Nodal cilia in *Kif3B*$^{-/-}$ mutant



Nonaka *et al.*, 1998 Cell

Leftward flow in wt mouse node while not *Kif3b*$^{-/-}$ node

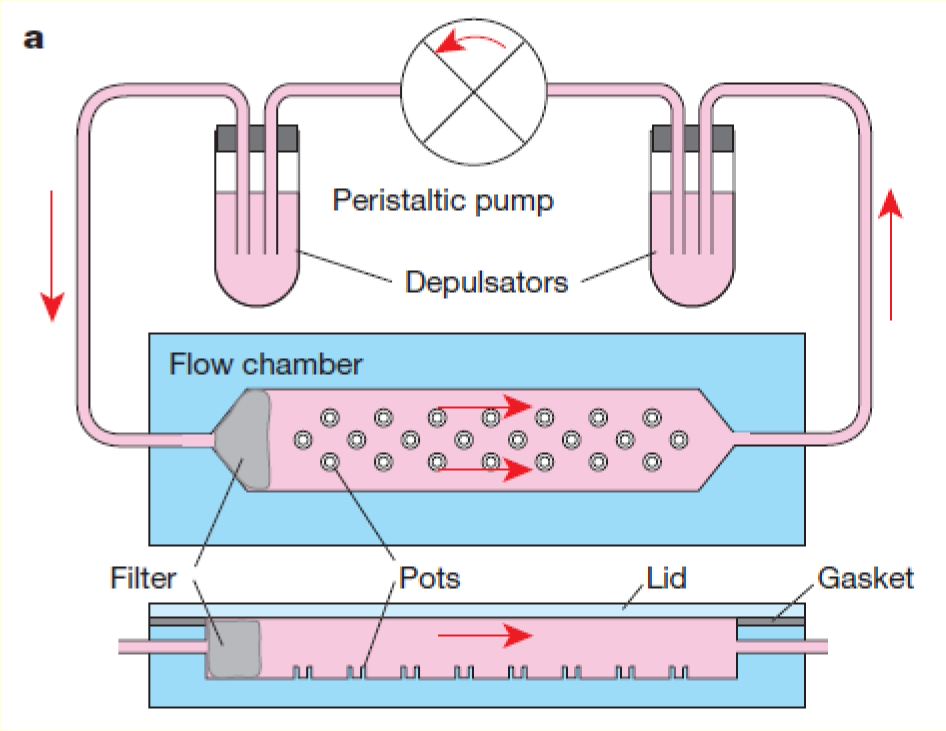
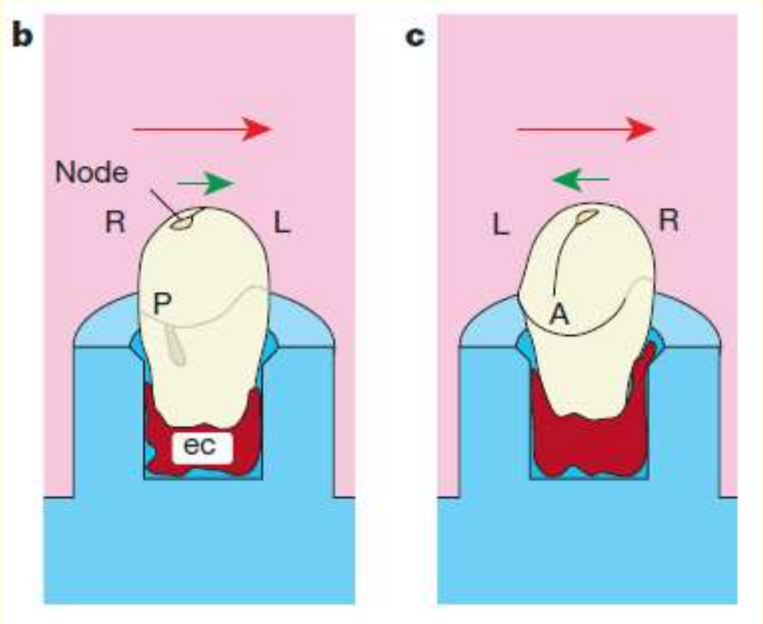
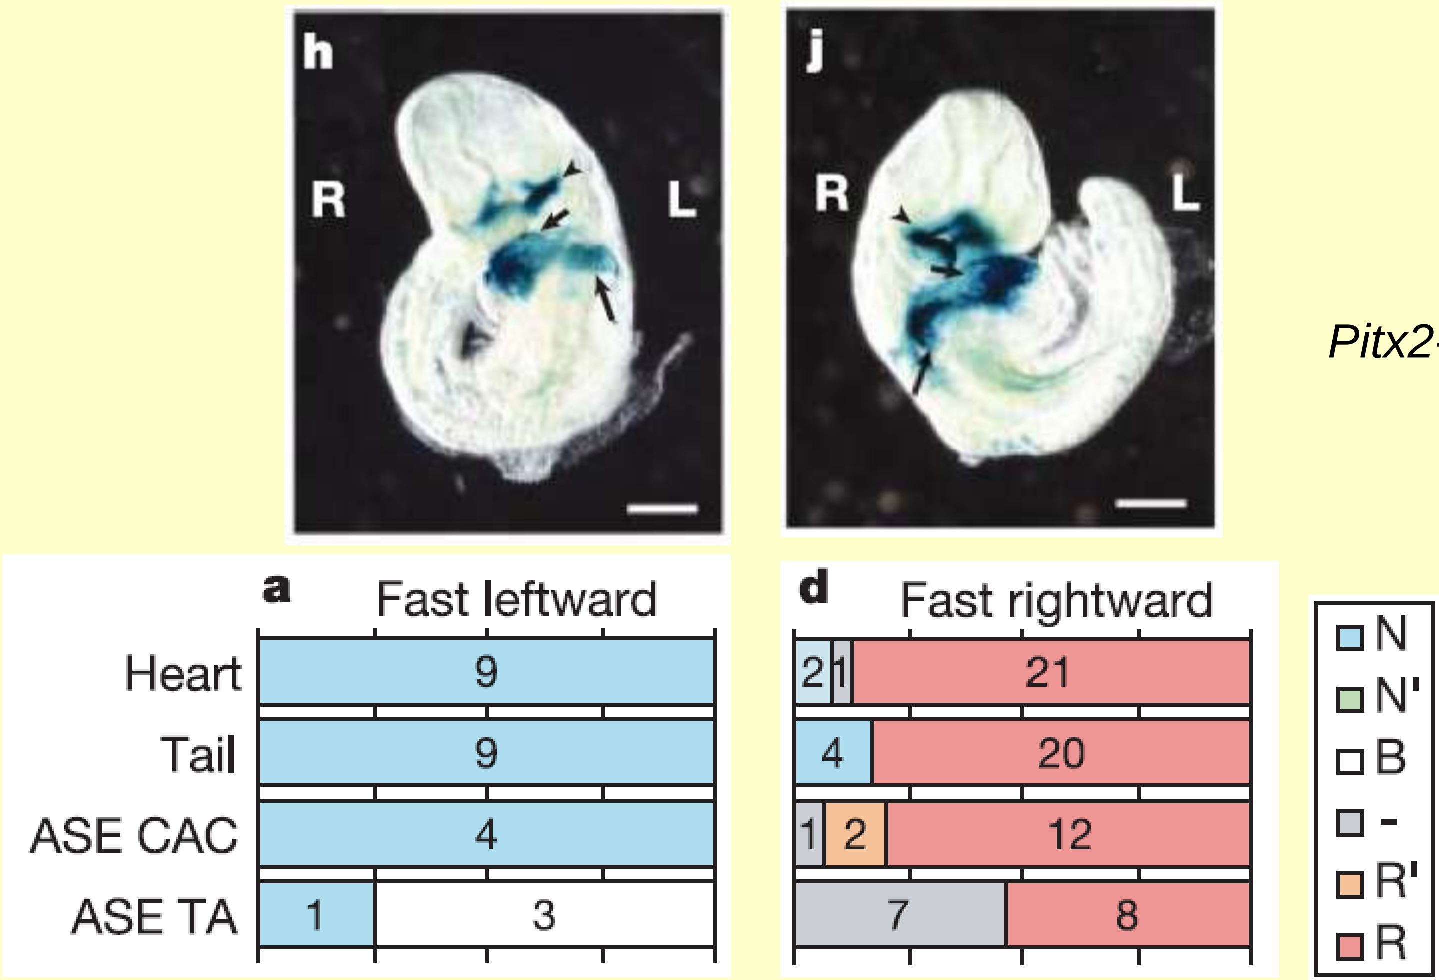
Devise for artificial nodal flow





Nonaka *et al.*, 2002 Nat.

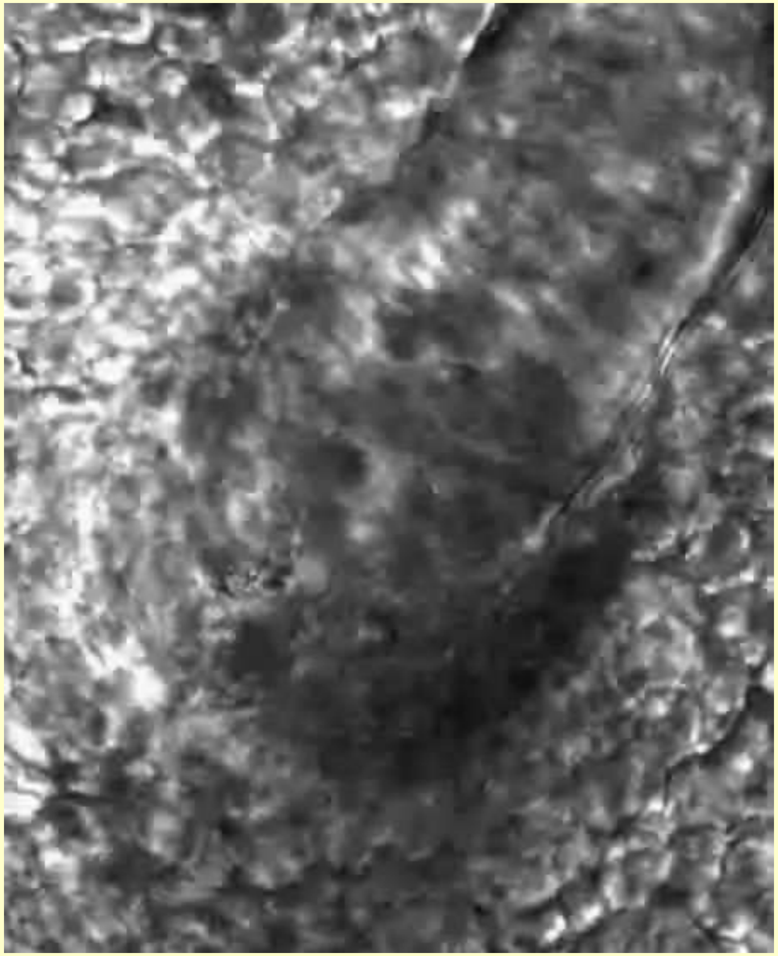
LR patterning is reversed by artificial nodal flow

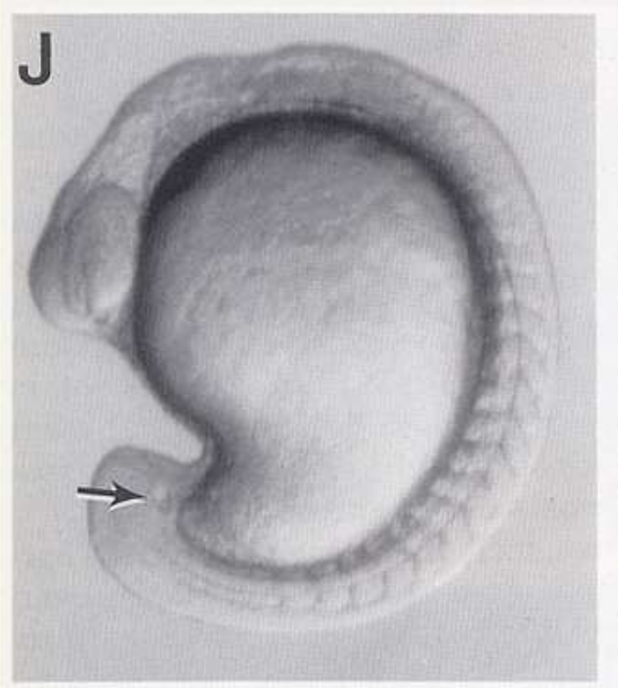


Pitx2-lacZ

Nonaka *et al.*, 2002 Nat.

LR is controled by flow in Kupffer's vesicle





15-somites

Model for LR patterning in zebrafish

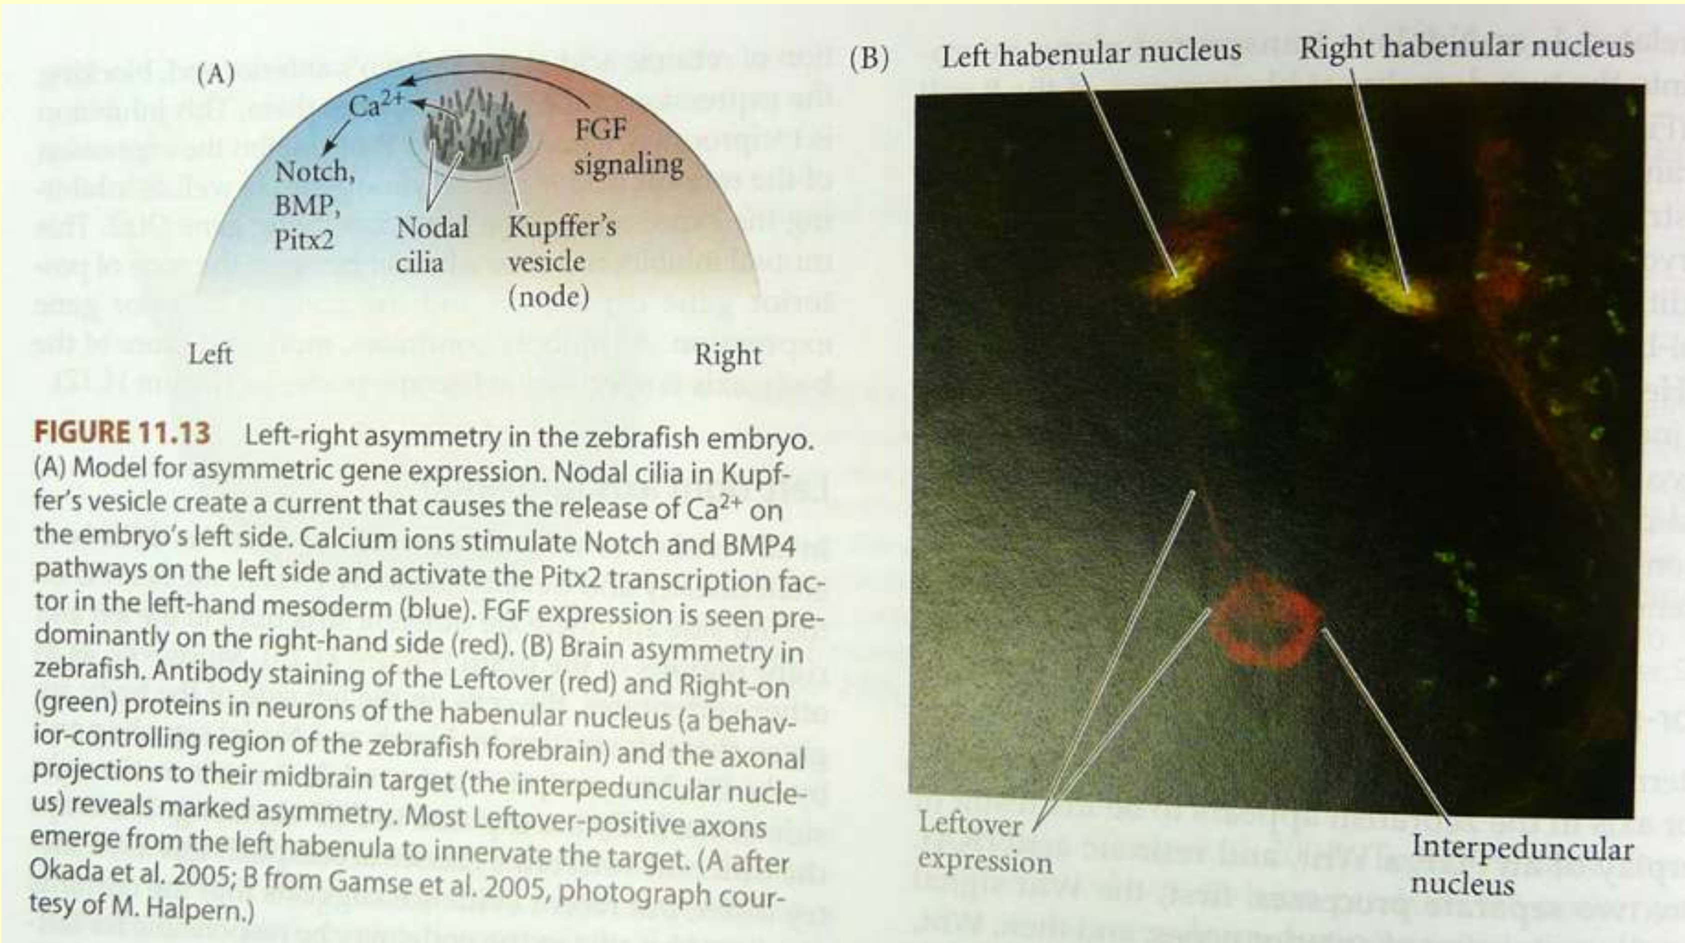


FIGURE 11.13 Left-right asymmetry in the zebrafish embryo. (A) Model for asymmetric gene expression. Nodal cilia in Kupffer's vesicle create a current that causes the release of Ca^{2+} on the embryo's left side. Calcium ions stimulate Notch and BMP4 pathways on the left side and activate the Pitx2 transcription factor in the left-hand mesoderm (blue). FGF expression is seen predominantly on the right-hand side (red). (B) Brain asymmetry in zebrafish. Antibody staining of the Leftover (red) and Right-on (green) proteins in neurons of the habenular nucleus (a behavior-controlling region of the zebrafish forebrain) and the axonal projections to their midbrain target (the interpeduncular nucleus) reveals marked asymmetry. Most Leftover-positive axons emerge from the left habenula to innervate the target. (A after Okada et al. 2005; B from Gamse et al. 2005, photograph courtesy of M. Halpern.)

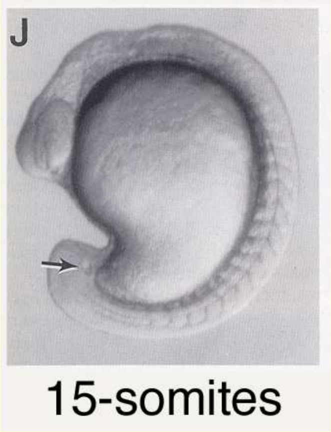
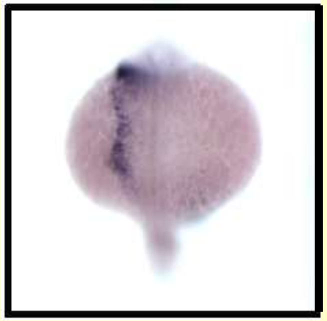
Model for LR patterning

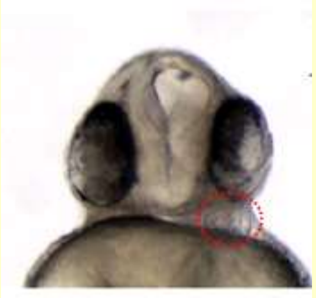
Flow driven by cilia



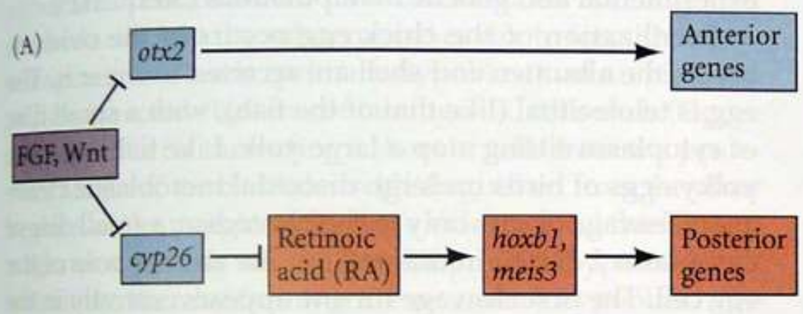
Nodal genes express on left side



LR patterning



Mechanism of AP patterning in zebrafish



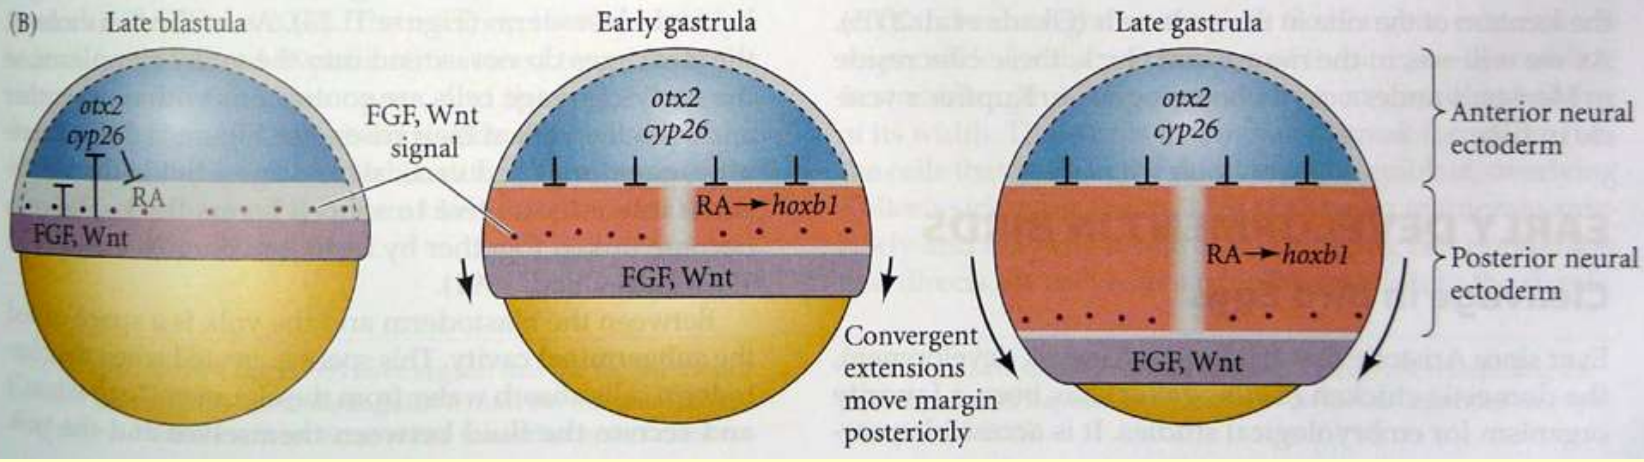


FIGURE 11.12 Model for the specification of zebrafish neural ectoderm by Fgf, Wnt, and retinoic acid (RA) signaling. The *Cyp26* gene encodes retinoic acid-4-hydroxylase, a cytochrome family enzyme that degrades retinoic acid. (A) Pathway through which a boundary can form between anterior (*Cyp26*-, *Otx*-expressing) and posterior (*hoxb1*-, *meis3*-expressing) neural ectoderm. In the posterior region, Fgf and/or Wnt suppress anterior genes such as *Otx2*. The Fgf /Wnt signal also suppresses *Cyp26* expression posteriorly, so retinoic acid accumulates (due to the absence of retinoic acid-4-hydroylase) and activates the posterior genes. (B) Temporal sequence of the posteriorization process. In late blastula stage, the *Cyp26* gene is confined to the anterior region by Fgf and Wnts from the margin. After the start of gastrulation, convergent extension takes the margin farther from the anterior. Retinoic acid accumulates in this region and activates genes associated with the posterior neural ectoderm. (After Kudoh et al. 2002.)

Summary (III)

- Key word:

  LR patterning, Shh Signaling, Nodal signaling, Cilia

- Event and mechanism:

  LR patterning, AP patterning
